imdea nanoscience institute

nanoscience and nanotechnology: small is different

imdea nanoscience

annual report

2013
Rodolfo Miranda
Director, IMDEA Nanoscience Institute
may 2014
IMDEA Nanociencia has taken a giant step forward during 2013. With the steady support (and not only financial) from the Regional Administration we have organized in the new building more than 30 working research labs, the brand new Centre for Nanofabrication with its 200 square meters clean room that is part of the Campus of International Excellence UAM+CSIC, the mechanical workshop and the Helium liquefier and recovery system. Most of the equipment and facilities needed to carry out first class research are already available to our researchers.

Additionally, during 2013 we have set a new Research Programme on Nanomedicine, hired the first scientists for this Programme and establish a close collaboration with medical doctors to address oncological problems with a fresh approach that involve the use of magnetic nanoparticles for hyperthermia (see Research Highlight below). New patents have been granted to IMDEA Nanociencia during 2013, while the scientific production has reached more than 140 papers this year, often published in the highest impact journals (average impact factor of  5.53), with an average number of citations during 2013 of more than 2000 and an institutional h-index of 37.

Producing basic science has not been the only task of our researchers: the contracts and projects together with companies have kept the steep increase of the past years, realizing our goal of incorporating the strategic needs of companies into our research programmes. We have further developed the international presence of our Institute by establishing close relations with policy makers and research organizations from China, Marocco, Argentina, Poland and other countries.

Our researchers have received a variety of honors during 2013: Dr. J.L. Delgado received the Young Researcher Award from Lilly and the Sigma Aldrich Emerging Investigator Award, Dr. Alfonso Latorre, the Richard Smalley Award from the Electrochemical Society, Dr. Begoña Sot the “Woman in Science” prize from L’Oreal and our associate researchers Profs. Tomás Torres and José L. Carrascosa, the Gold Medal from the Royal Society of Chemistry of Spain and the National Prize from the Spanish Society of Virology, respectively.

Our best values, however, have been the enthusiasm that one can feel walking the corridors of the Institute, the forward thrust of our scientists and managers and the atmosphere of collaboration and genuine commitment. Let’s do what is needed to keep this music playing.

With my warmest thanks to all involved in IMDEA Nanociencia.

1.1. Legal Status

IMDEA-Nanociencia is a private non profit Foundation created by initiative of the Madrid Regional Government in November 2006, in order to shorten the distance between the research and society in the Madrid region and provide new capacity for research, technological development and innovation in the field of Nanoscience, Nanotechnology and Molecular Design. In 2007 the former Ministry of Education and Science of the Government of Spain decided to also fund part of the creation and equipment of an institute of Nanoscience in the Madrid autonomous region.

The Foundation is governed by a Board of Trustees, which has representatives of the national and regional administration, the Academic Institutions (Complutense, Autonoma and Politecnica Universities, Consejo Superior de Investigaciones Cientificas), industries, members of the Scientific Advisory Council, and experts in societal implications of nanoscience and technology transfer.

The Foundation governs the IMDEA-Nanociencia Institute, a new interdisciplinary research centre dedicated to the exploration of basic nanoscience and the development of applications of nanotechnology in connection with innovative industries. The IMDEA-Nanociencia Institute is part of one of the strategic lines of the Campus of International Excellence (CEI) UAM+CSIC.

1.2. Strategic Goals

In the region of Madrid there is already a large community of physicists, chemists and biologists working actively on diverse aspects of Nanoscience. Many of these groups have a recognized international prestige in their respective fields. In spite of this, a new step forward is needed to facilitate the future international competitiveness of the R+D in Nanoscience and Nanotechnology; it is necessary to create a suitable organizational and working environment to promote the continuous interdisciplinary interaction between specialists in condensed matter physics, chemistry, molecular biology, computer sciences, etc., that demands the very nature of this new discipline.

Moreover, it is essential to be able to recruit and retain new talent and to repatriate some young scientists working abroad, to train a new generation of technicians and scientists in a genuine interdisciplinary discipline, and to create and maintain new experimental equipments and advanced infrastructures.

All this must be done by coordinating efforts with the groups and institutions that already exist, thanks to a flexible structure based on research programmes, which will have to undergo periodic evaluations. IMDEA-Nanociencia aims at becoming an internationally recognized research center, while maintaining a clear support from the existing scientific community in Madrid.
1.3. Location

IMDEA Nanociencia has been located provisionally mostly in spaces from the School of Sciences of the UAM and the School of Chemistry of the UCM. The building of IMDEA Nanociencia is at the Campus of the UAM in Cantoblanco, near Madrid. Given the interdisciplinary nature of research in Nanoscience, the location of the Institute in an environment characterized by its excellence in related research areas is ideal. The foundation stone was laid on a public ceremony on January, 13th, 2010. The building was completed by December 2011 and is fully operational since June 2012. Its 8,200 m² host 44 laboratories, offices and facilities such as the Center for Nanofabrication of the Campus of International UAM+CSIC or the Center for Ultra-High Resolution Electron Microscopy.
The new building of IMDEA-Nanociencia will host approximately 100 senior and post-doctoral researchers from different areas, 20 laboratory technicians, 15 management and administration staff and the appropriate number of graduate students. The building is designed to hold sufficient free space to ensure the rotation of research groups and the future incorporation of new programmes.

1.4. Recruitment Procedure

Staff scientists of IMDEA Nanociencia are recruited on the basis of International Open Calls in which the candidates present a scientific proposal and a CV. The Scientific Advisory Committee selects a group of candidates to be interviewed by the Direction. After the selection and negotiation process, the candidates are presented to the Board of Trustees and then the offer is made. Postdocs and Ph. D. are also recruited on an internationally competitive basis, but selected directly by their corresponding supervisors from the staff.

Researchers from different universities, the CSIC or other public institutions may also apply to the same selection procedure and be incorporated to the Institute as associated members for periods of five years to develop specific research projects. The corresponding agreements with different academic institutions have been signed.

As a result of the recruitment procedure, 81 scientists work at IMDEA Nanociencia, 11 of which are associate scientists, and 32 are paid by various competitive programmes. Currently, 30% of the scientific staff is foreign (12 different countries), and 88% have previously worked in foreign institutions.

Programme 4
Nanobiosystems: Biomachines and Manipulation of Macromolecules

Programme 5
Nanoelectronic and Superconductivity

Programme 6
Nanosurfaces and nanodevices

Programme 7
Nanomedicine
programme 1
molecular nanoscience

This programme deals with the design and synthesis of molecular nanostructures and nanomaterials, their spectroscopic characterization, in particular, their time-resolved optical response, and their self-assembly at surfaces. The expertise required includes the functionalization of different nanoforms of carbon, organometallic compounds and semiconducting quantum dots to self-organize on surfaces by means of covalent or supramolecular approaches and the implementation of various spectroscopic techniques, including spectroscopy on single molecules. Among the practical objectives of the Programme one may cite the optimization of organic solar cells and other functional organic devices.

Chemical synthesis

Prof. Nazario Martín
Programme Manager
Double Affiliation: Universidad Complutense de Madrid, Spain

Nazarío Martín (Madrid, 1956) is full professor of Organic Chemistry at the University Complutense of Madrid and vice-director of the Institute for Advanced Studies in Nanoscience of Madrid (IMDEA-Nanoscience). Recently he has been appointed as Dr. h.c. by La Havana University. Professor Martín’s research interests span a range of targets with emphasis on the molecular and supramolecular chemistry of carbon nanostructures such as fullerenes, carbon nanotubes and graphenes, p-conjugated systems as molecular wires and electroactive molecules, in the context of electron transfer processes, photovoltaics applications and nanoscience. He has published over 420 papers in peer reviewed journals, given over 260 lectures in scientific meetings and research institutions, and supervised 25 theses. He has co-edited six books related with carbon nanostructures and he has been invited as guest editor for eight special issues in well-known international journals. Professor Martín has been visiting professor at UCSB and UCLA (California, USA) and Angers and Strasbourg (France) universities. He has served as a member of the Editorial Board of Chemical Communications, and he has served as General Editor of the Spanish journal Anales de Química (2000-2005) and as a member of the International Editorial Advisory Board of The Journal of Materials Chemistry (2000-2006). He is currently the Regional Editor for Europe of the journal Fullerenes, Nanotubes and Carbon Nanostructures and a member of the International Advisory Board of The Journal of Organic Chemistry (ACS), ChemSusChem (Wiley-VCH), ChemPlusChem (Wiley-VCH), Chemical Society Reviews (RSC) and Chemical Communications (RSC). He is a member of the Royal Academy of Doctors of Spain as well as a fellow of The Royal Society of Chemistry. In 2006-2012 he has been the President of the Spanish Royal Society of Chemistry. He has been the recipient of the “Dupont Prize of Science” in 2007 and of the “Gold Medal and Research Award” in 2012, the highest distinction given by the Spanish Royal Society of Chemistry. He has recently been appointed with the national “Jaime I Award for basic research” 2012. He is the last chemist distinguished with the “EuCheMS Lecture Award” in 2012.

Supramolecular chemistry and self-assembly of functional materials

Dr. Emilio Pérez
Researcher
Ph.D.: University of Edinburgh, UK
Previous Position: Universidad Complutense de Madrid, Spain

Emilio M. Pérez obtained his BSc (2000) and MSc (2001) from the Universidad de Salamanca, working in the design and synthesis of enantioselective receptors for a-aminoacids under the supervision of Prof. Joaquin R. Morán. He then joined the group of Prof. David A. Leigh at the University of Edinburgh (UK) where he obtained his PhD in 2005. His PhD work was recognized with the 1st Prize at the 2004 Society of Chemical Industry Symposium on Novel Organic Chemistry and the 2006 IUPAC Prize for Young Chemists. He joined the group of Prof. Nazario Martin at the Universidad Complutense de Madrid in 2005. During his stay in Madrid, he has received the 2009 Real Sociedad Española de Química Prize for Novel Researchers and the 2010 Universidad Complutense de Madrid Foundation Prize for Science and Technology. In December 2008 he joined IMDEA Nanoscience as a Ramón y Cajal researcher. In 2011-2012 he received support from both Spanish (MINECO, group A call) and European (ERC Starting Independent Research Grant) sources to establish his own research group at IMDEA. His main research interests concern the development of unconventional methods for the modification of carbon nanotubes, molecular recognition, the self-assembly of functional materials and the construction of molecular machinery.

Relevant publications

Design and synthesis of molecular nanostructures and nanomaterials

Dr. Juan Luis Delgado
Researcher
Ph.D.: Universidad de Castilla-La Mancha, Spain
Previous Position: Universidad Complutense de Madrid, Spain

Juan Luis Delgado obtained his PhD in Chemistry (2004) from the Universidad de Castilla-la Mancha, with a work on materials for photovoltaic applications. He then joined the group of Prof. Jean-François Nierengarten, at the CNRS (Strasbourg and Toulouse, France) working on covalent and supramolecular fullerene chemistry and conjugated systems (2005-2006). Currently, he holds a “Ramón y Cajal” research contract at IMDEA-Nanosciencia, where he is focused on the synthesis and design of new carbon-based energy storing materials for the development of more efficient organic photovoltaic devices.

Organic Functional Materials

Prof. Tomás Torres
Associated Senior Scientist
Ph.D.: Universidad Autónoma de Madrid, Spain
Double Affiliation: Universidad Autónoma de Madrid, Spain

Tomás Torres is Professor of Organic Chemistry at UAM. His group, twenty-five researchers, has an experience of 20 years in Organic Molecular Materials. He has published 370 papers and 40 patents, given 200 lectures, and supervised 30 PhD theses. In 2001 he was distinguished as a Visiting Fellow of the Japan Society for the promotion of Science. He has been awarded the JANSSEN CILAG prize for Organic Chemistry 2005 by the Royal Society of Chemistry of Spain. In 2009 he has also been honoured as Doctor Honoris Causa by the Ivanovo State University of Chemistry and Technology, Russia.

Research lines
In addition to various aspects of synthetic and supramolecular chemistry his current research interests include the preparation and study of photophysical properties of organic functional materials. His group is currently exploring several areas of application of phthalocyanines, porphyrins and carbon nanostructures (carbon nanotubes, graphene), including organic and hybrid solar cells, with a focus on nanotechnology.

Relevant publications

Hybrid systems based on semiconductor nanoparticles

Dr. Beatriz H. Juárez
Associated Scientist
Ph.D.: Universidad Autónoma de Madrid, Spain
Double Affiliation: Universidad Autónoma de Madrid, Spain

Beatriz Hernández Juárez is associated professor at the Universidad Autónoma de Madrid (from Sep. 12) and former researcher in the “Ramón y Cajal” programme at IMDEA Nanoscience. She received a B.Sc. degree in Chemistry from the Universidad Complutense de Madrid (UCM) in 1999 and a Ph.D degree in Material Sciences from the Universidad Autónoma de Madrid (UAM) in 2005 with a work on Photonic Crystals supervised by Prof. C. López. Dr. Hernández also worked for almost 2 years in Lucent Technology, a factory devoted to the fabrication of microelectronic circuits in a clean room laboratory. After finishing the PhD, she moved to the Laboratoire de Photonique Quantique et Moleculaire (LPQM) in Paris. After a short stay, she joined the group of Prof. Dr. Horst Weller in Hamburg (http://www.chemie.unihamburg.de/pc/weller/index.html) with a Marie Curie Individual Intra European Fellowship.

Designed functional nanomaterials

Prof. Félix Zamora
Associated Scientist
Ph.D.: Universidad Autónoma de Madrid, Spain
Double Affiliation: Universidad Autónoma de Madrid, Spain

Félix Zamora received his PhD from the Universidad Autónoma de Madrid (Spain) in 1994 to 1996 he worked at University of Dortmund (Germany) as a postdoctoral HCM EU fellowship. He was visiting professor at Virginia University (USA), New Castle University (UK) and National Singapore University (Singapore). From 2002, he is “Profesor Titular” at the Inorganic Chemistry Department at the Universidad Autónoma de Madrid, and associate research at IMDEA Nanoscience. His research group is mainly focused in the production of functional nanomaterials. He is co-author of more than 100 papers in international first line journals (including Nature Nanotech., Nature Commun., Chem.Soc.Rev., Angew. Chem., JACS, Chem.Sci., Adv. Mater., ACS Nano, ... ) and member of the Editorial Board of Scientific Reports (Nature Publishing Group). He is co-founder and scientific assessor of the company Nanoinnova Technologies (spin-off UAM company, www.nanoinnova.com) a company devoted with the commercialization of nanomaterials and devices useful at the nanoscale.

Research lines
His current research is focused on the synthesis of novel nanomaterials using several strategies based on metal modified DNA, coordination and MMX polymers, and carbon based materials (graphene, CNT and carbon nitrides). His research group is pioneer in the developing of new adsorption methods of MMX and coordination polymers which are suitable for study properties at the nanoscale. They have developed a new source of graphene alternative 2D polymers based on MOFs and COFs. The group has a large list of collaborators all over the world, and some international companies (Abengoa Res., Intel Co., Nanotech Electrónica, ...).

Optical spectroscopy of polyconjugated materials

Prof. Johannes Gierschner
Senior Researcher
Ph.D.: University of Tübingen, Germany
Previous Position: University of Mons, Belgium

Johannes Gierschner received his PhD in 2000 in Tübingen (Germany), followed by a position as researcher, lecturer, and institute manager in equal shares. In 2004 he moved to Mons (Belgium) with D. Beljonne & J. Cornil, including a 4-month stay with J.-L. Brédas at GeorgiaTech. In 2008 he became Ramón y Cajal research fellow and Senior Researcher at IMDEA Nanoscience. He was visiting researcher in Valencia (2008-10) and holds regular visiting researcher positions in Tübingen and Seoul National University. JG has coordinated National and European projects and has published more than 70 peer-reviewed papers (1900 cites, h = 25).

Research lines
JG’s work integrates steady-state and time-resolved optical spectroscopy with quantum-chemical methods to achieve an in-depth understanding of the signatures and fates of excitons in organic materials for optoelectronic applications, with special focus on environmental effects in polymers (including aggregation, disorder, temperature, etc), single crystals of structurally well-defined oligomers and supramolecular nanostructured multi-chromophore systems.

The use of advanced microscopies and spectroscopies with atomic resolution is essential to characterize matter at the nanoscale. The scientists involved in this programme develop advanced Scanning Probe Microscopes, mostly STM, AFM and Photoelectron Microscopy to investigate problems such as the epitaxial growth of graphene, the self-assembly of molecules at surfaces, the realization of inelastic spectroscopy at the level of single molecules or the spin polarized imaging of magnetic nanostructures. Friction at the nanoscale and theoretical modelling are also involved. Activities of this programme have implications for aeronautics and energy applications and closely interact with the ones of Programmes 1 and 3.

**Relevant publications**
Nanotribology

Prof. Enrico Gnecco
Senior Researcher
Ph.D.: University of Genova, Italy
Previous Position: University of Basel, Switzerland

Enrico Gnecco received his PhD in Physics from the University of Genova in 2001, and worked several years at the University of Basel before joining IMDEA Nanociencia in 2010. Among other topics, he investigated atomic-scale friction of metal, insulating and semiconducting surfaces in ultra-high vacuum, the onset of abrasive wear on crystal surfaces on the nanoscale, the transition from stick-slip to superlubricity, the phononic and electronic contributions to dissipation in close proximity to solid surfaces, and the confinement of organic molecules on insulating surfaces caused by artificial nanostructures. Enrico Gnecco co-authored about 70 peer-reviewed articles (including publications in Science, Nature Materials, PNAS and Nanoletters) and 4 book chapters. He also wrote the book “Nanoscale Processes on Insulating Surfaces” (World Scientific, 2009) with Marek Szymonski, and edited the book “Fundamentals of Friction and Wear on the Nanoscale” (Springer, 2007) with Ernst Meyer. Last but not least, he was awarded a diploma in piano from the Conservatory of Music of his hometown, Genova.

Research lines
At IMDEA Nanociencia Prof. Gnecco is leading the nanotribology group, focusing on friction, adhesion and wear processes on the nanoscale. Both experimental (atomic force microscopy and related techniques) and theoretical (analytical models based on classical mechanics and reaction rate theory) approaches are explored. Our current research topics are friction in liquid environments, nanomanipulation of organic molecules, and nanostructuring of polymers caused by visco-plastic deformations. The ultimate goal of his work is to control friction and particle manipulation at the nanoscale.

Ph.D.: Universidad Autónoma de Madrid, Spain.
Previous Position: Toshiba Research Europe Ltd. (TREL), Cambridge, UK

Daniel Granados worked as Ph.D. student at the group of molecular beam epitaxy of IMM-CNM-CSIC, on the growth and characterisation of III-V semiconductor Nanostructures. For six months he was an invited researcher at the Nano-Optics group of the Heriot-Watt University in Edinburgh (Scotland), working on single Quantum dot optical characterisation. After this, Dr. Granados joined the Quantum Information Group of Toshiba Research Europe Ltd in Cambridge (UK), as a research scientist; working on photon confinement and cavity quantum electrodynamics. He joined IMDEA Nanoscience in September 2009. Since January 2014 he is Senior Scientist and RyC fellow.

Research lines
My research interests are the micro and nanofabrication of electronic and photonic devices for photonics, nano-optics and quantum information processing, as well as the growth, characterisation and technologies based on graphene and other 2D materials. Recently, I have started to work on near field optical characterisation and optical Scanning tunnelling microscopy.

Spin-Polarized STM

Dr. Fabián Calleja
Researcher
Ph.D.: Universidad Autónoma de Madrid, Spain.
Previous Position: École Polytechnique Fédérale de Lausanne (EPFL), Switzerland

Fabian Calleja got his Ph.D. from the Universidad Autónoma of Madrid (UAM) in October 2007 with a work on the development of variable temperature STM. After his PhD, Dr. Calleja worked as a post-doctoral researcher in the group of Prof. Harald Brune in the Laboratory of Nanostructures at Surfaces (LNS) of the Institute of Condensed Matter Physics (ICMP) at the Federal Politechnical School of Lausanne (EPFL) from April 2008 to December 2010. Since January 2011 he is a Junior Researcher at IMDEA Nanociencia.

Research lines
Study of the electronic and magnetic properties of very small systems, ranging from single atoms or molecules to clusters of arbitrary size up to complete monolayers supported on different substrates. The experimental technique employed is the Spin-polarized Scanning Tunneling Microscopy (SP-STM) performed under Ultra High Vacuum (UHV) conditions.

Relevant publications

MBE growth of magnetic and organic thin films and nanostructures. Photoelectron Microscopy

Dr. Miguel Ángel Niño
Researcher
Ph.D.: Universidad Autónoma de Madrid, Spain.
Previous Position: Elettra Synchrotron Radiation Facility (Trieste), Italy.

Miguel Angel Niño received his PhD at Universidad Autónoma de Madrid working on magnetic self organized nanostructures and metastable alloys. Then he joined the X-ray Microscopy group of A. Locatelli and M. Kiskinova at Elettra Synchrotron (Italy) as post-doctoral fellow, and after as beamline scientist, performing Photoemission Electron Microscopy and Low Energy Electron Microscopy applied to growth and characterization of magnetic thin films and nanostructures. With more than 45 publications in international journals and more than 70 communications at international congresses, he joined IMDEA Nanoscience in 2011.

Research lines
- Characterization of nanostructures and nanoparticles on surfaces with X-ray techniques and photoelectron microscopy.
- MBE growth of thin films with applications in magnetic systems: control of magnetoresistance and magnetic anisotropy through atomic interface design and electric fields.
- Hybrid molecular-magnetic structures: organic spin valves, molecular magnets, chiral molecules on surfaces.
- MBE growth of organic solar cells.

Relevant publications

MBE growth of organic solar cells.

Dr. Cristina Navío
Postdoc
Mons University, Belgium
Amadeo L. Vázquez de Parga got his PhD in 1992 at the Universidad Autónoma de Madrid (UAM). Construction of a Scanning Tunneling Microscope (STM) working in ultra high vacuum, the first in Spain. He carried out a postdoc stay at IBM Research Laboratory in Rüschlikon (Switzerland) in photoluminescence excited by the STM. From 1999 Prof. Vázquez de Parga is Associate Professor in Condensed Matter Physics at the UAM and from 2008 Associated Senior Researcher at IMDEA-Nanoscience.

2002-2003 visiting researcher at the Radboud University, Nijmegen (The Netherlands), working on spin polarized STM

Short research stays at Lawrence Berkeley Laboratory, California (1990), Max Planck Institute in Halle (Germany) (2000) and at University of Gakushuin, Tokio (Japan) (2004)

Research lines
Currently we are working on graphene grown on different transition metals studying the crystallographic and electronic properties. Graphene is also used as substrate for molecular deposition. We are currently doing spin polarized STM measurements on molecules deposited on magnetic substrates. Another research line is the study of molecular self-assembly on metallic surfaces. The main techniques are scanning tunneling microscopy and spectroscopy, Low energy electron diffraction, Auger spectroscopy and X-ray photoelectron spectroscopy.

**Theoretical Study of Molecules on Surfaces**

*Dr. Manuel Alcamí*
Associated Senior Scientist  
PhD: Universidad Autónoma de Madrid, Spain
Double Affiliation: Universidad Autónoma de Madrid, Spain

Manuel Alcamí is full Professor of Chemical Physics at the Department of Chemistry at UAM and Associated Senior Scientist at IMDEA. He graduated in Chemistry at UAM in 1987 and received his PhD in Quantum Chemistry in 1990. He did a postdoctoral stage (1991-1993) at the University of Newcastle upon Tyne (UK).

He is the national coordinator of the inter university master and doctorate programs in Theoretical Chemistry and Computational Modelling (www.emtccm.org) and the chair of the COST Action CM1204 XLIC: XUV/X-ray light and fast ions for ultrafast chemistry (www.xlic.eu)

**Research lines**

His field of expertise is the theoretical study of molecules both in gas phase and deposited on surfaces. His current research lines are:

- Theoretical study of self-assembly and charge transfer processes of molecules deposited on surfaces.
- Carbon nanostructures: fullerenes, fullerene metal derivatives and graphene.
- Fragmentation and stability of highly charged and highly excited molecules.

**Relevant Publications**

**Atomic and molecular self-assembly at surfaces**

*Dr. Roberto Otero*
Associated Scientist  
Ph.D.: Universidad Autónoma de Madrid, Spain
Double Affiliation: Universidad Autónoma de Madrid, Spain

Dr. Roberto Otero received his Ph.D. degree from Universidad Autónoma de Madrid in 2002 under the supervision of Prof. Rodolfo Miranda, working on the relations between the electronic structure and the morphology of inorganic nanostructures. He then moved to the University of Aarhus, Denmark, where he joined the group of Prof. Flemming Besenbacher as a postdoctoral assistant. There, he got involved in the research about the self-assembly of organic molecules on solid surfaces by Variable-Temperature, Fast-Scanning Tunneling Microscopy. He is presently associated Researcher at IMDEA Nanoscience.

**Research lines**

The current scientific interest of Dr. Roberto Otero focus on the structural and chemical characterization of the interfaces between metals and organic materials, interfaces which are important for the performance of many organic electronic, optoelectronic and photovolatile devices. For carrying out such studies, Dr. Roberto Otero uses an optimized experimental system that combines X-Ray Photoelectron Spectroscopy (XPS) and Variable-Temperature Scanning Tunneling Microscopy (VT-STM).

Physics of surfaces and thin films

Prof. José María Gallego
Associated Scientist
Ph.D.: Universidad Autónoma de Madrid, Spain
Double Affiliation: Instituto de Ciencia de Materiales de Madrid-CSIC

José María Gallego received his B.S. degree in physics from the Universidad Autónoma de Madrid in 1986 and completed his Ph.D. in 1991 with Prof. Rodolfo Miranda. He continued his postdoctoral studies with Prof. Ivan K. Schuller at the University of California in San Diego, before joining the Spanish Consejo Superior de Investigaciones Científicas (CSIC) in 1996 as a tenured scientist. In December 2010 he joined IMDEA-Nanociencia as an Associated Researcher.

Research lines
His research interest is centered on the physics of surfaces and thin films, in particular in scanning tunneling microscopy and electron spectroscopy studies of epitaxial growth, in ultrahigh vacuum conditions, of both organic and inorganic materials on solid surfaces.

Relevant Publications:
Growth and characterization of magnetic nanomaterials

Prof. Julio Camarero
Associated Senior Scientist
Ph.D.: Universidad Autónoma de Madrid, Spain
Double Affiliation: Universidad Autónoma de Madrid, Spain

Julio Camarero received his PhD in physics from the Universidad Autónoma de Madrid in 1999. He then worked at Institut Néel-CNRS France (Marie-Curie Fellow and scientific contracts) before returning to UAM in 2003 as Ramón y Cajal research fellow. He is currently Associate Professor of the Condensed Matter Physics Department and Secretary of the Institute of Materials Science “Nicolás Cabrera”. In 2008 he joined the Nanomagnetism Group at IMDEA Nanoscience as Associated Senior Scientist. He has published more than 60 regular papers (> 950 cites, h-index: 16), 9 book chapters, 4 invited papers, and 1 EU patent. 20 invited talks at international conferences (150 other conference presentations). Dr. Camarero is a frequently invited scientist in different Synchrotron Radiation Facilities (60 weeks).

Research lines
Currently, his goal is to acquire a better understanding of the fundamental physics of new functional properties that are important, or may become important, for applications in Spintronics and Biomedicine areas. His main scientific interests are: development of new hybrid (inorganic-organic) magnetic nanostructures, magnetization reversal processes, polarization dependent x-ray spectroscopy and microscopy, sub-nanosecond and element resolved magnetization reversal dynamics, nanomagnetism and biomedicine.

Relevant Publications

This Programme deals with the preparation and characterization of Advanced Magnetic Nanomaterials and explores some of their biomedical applications. The materials, both inorganic and organic, are grown by Molecular Beam Epitaxy (MBE) in ultra-high vacuum environment, by sputtering or by chemical synthesis. They are ultrathin films, superlattices, or nanoparticles and their magnetic properties are characterized by morphological, structural, electronic, and (mostly optical) Magnetometry techniques. Additionally, large scale experimental facilities (i.e., synchrotron, neutron, or ion-accelerator sources) are often used to elucidate some fundamental aspects. Particular emphasis is placed on magnetization reversal processes of low-dimensional artificial magnetic structures. The preparation and characterization of magnetic nanoparticles for use in Nanobiomedicine has recently emerged as an important research line in this Programme with the aim to develop ultrasensitive NMR molecular imaging agents, magnetic carriers for in vivo targeting of therapeutic compounds or hyperthermia treatment of cancer. Appropriate theoretical modelling also plays a role in the Programme.
Spintronics and biomedical applications

Dr. Alberto Bollero
Researcher
Ph.D.: Technical University of Dresden, Germany
Previous Position: CIEMAT, Spain

Alberto Bollero got a B.Sc degree from the Universidad Complutense de Madrid. He was a PhD student at the IFW-Dresden, working on nanocrystalline magnetic materials and got his PhD degree at the Technical University of Dresden in 2003. He has been Postdoctoral at the University of Leipzig, studying magnetic and magnetotransport properties of thin films, and Marie Curie Fellow at SPINTEC (CEA-Grenoble) on exchange bias systems for magnetic applications. Dr. Bollero was researcher at CIEMAT-Madrid: on photovoltaic applications and solar control coatings for architectural applications. Since 2010 he is “Ramón y Cajal” Fellow at IMDEA-Nanociencia.

Research lines
- Magnetic nanostructures for spintronics. Miniaturization of magnetic multilayered devices for technological applications in magnetic sensors based on spin valves and magnetic tunnel junctions. Magnetization reversal mechanisms and thermal stability.
- Magnetic nanoparticles with biomedical applications. Dynamic magnetic properties of nanoparticles for cancer therapeutic applications.

Ph. D. student
Beijing Normal University, China
This programme deals with the study of biological nanomachines, their assembly, structure and functional properties, as well as their interaction with defined substrates to build synthetic tools. In the area of Single molecule Analysis of Macromolecular Aggregates, there are groups working on protein engineering, computational chemistry, AFM analysis of macromolecular complexes, force spectroscopy analysis and manipulation of macromolecules and their aggregates, the study of nanomechanical properties of biological complexes of different complexities and optical trapping-based approaches to study the behavior of single biological nanomotors. Other systems under study are tailor-made polypeptides of increasing complexity designed to dissect relationships between molecular structure and functional properties. A second area of interest in this Programme is the organization of macromolecular complexes on well-defined substrates. Biological membranes, the protein folding and viral assembly pathways, the bacterial cytoskeleton and the DNA structure are examples of self-organizing systems under study with highly specialized functions and properties.

Prof. José L. Carrascosa
Programme Manager
Double Affiliation: Centro Nacional de Biotecnología CNB-CSIC, Spain

Prof. Carrascosa is Research Professor of the CSIC and Director of the Department of Structure of Macromolecules at the Centro Nacional de Biotecnología. He has been involved in the development of advanced microscopy methods for the structural analysis of biological material, with special emphasis in the study of different viral model systems. His activity has produced near 200 publications with an H index of 40.

Optical nanomanipulation in molecular and cell biophysics

Dr. Ricardo Arias-González
Researcher
Ph.D.: Universidad Complutense de Madrid, Spain
Previous Position: Centro Nacional Biotecnologia (CNB-CSIC), Madrid, Spain

Dr. Arias-González received both his Master Degree in Theoretical Physics in 1997 and his Ph.D. in 2002 from Complutense University in Madrid. During his Ph.D. research in the Materials Science Institute, Madrid, and short stays in École Centrale Paris and EMBL-Heidelberg, he developed theory and simulations to understand the electromagnetic field in nanoparticles. Then, he moved to U.C. Berkeley for his postdoctoral training, where he studied DNA with single molecule approaches. In 2006, he worked at the National Centre of Biotechnology, Madrid, where he developed a state-of-the-art optical tweezers. Since 2008, he has joined IMDEA Nanoscience, leading of the Optical Nanomanipulation Lab.

Research lines
Dr. Arias-González is working in the field of Molecular and Cell Biophysics, furthering the study of the macromolecules that make up the machinery of cells. His research lines cover three fundamental scale levels in Biology, namely, the molecule, the organelle and the cell. Specifically, his team investigates structural transitions of nucleic acids, molecular motors and electrophysiology of organelles from the single-molecule point of view. He is also interested in the development of biophysical techniques for these research purposes.

Optical and magnetic tweezers

Dr. Borja Ibarra
Researcher
Ph.D.: Universidad Autónoma Madrid, Spain / CNB-CSIC Madrid, Spain
Previous Position: Centro Nacional Biotecnologia (CNB-CSIC), Madrid, Spain

Borja Ibarra received his PhD. in Molecular Biology from the Universidad Autónome de Madrid in 2001. He made the ‘leap’ to molecular biophysics as a postdoctoral fellow at University of California, Berkeley. There, he learned the techniques of single-molecule force spectroscopy and using optical tweezers he developed a single-molecule mechanical assay to study the dynamics of molecular motors involved in DNA replication. Back in Spain in 2007, he applied this technology at the CNB-CSIC to study biological molecular motors at single molecule level. He joined the Nanobiosystems research line at IMDEA Nanoscience in 2010.

Research lines
Many essential processes inside the cell involve mechanical tasks, which are carried out by specialized proteins called molecular motors. They are able to convert chemical energy into mechanical work at the molecular scale and therefore, present interesting biomedical and nanotechnological applications. In our laboratory we use single molecule manipulation techniques to understand the physical mechanism by which these molecular machines operate.

Fernando Cerrón
Internship
Dr. Cristina Flors Ong
Researcher
PhD.: Institut Químic de Sarrià, Spain
Previous Position: University of Edinburgh, Edinburgh, UK

Cristina Flors completed a PhD in Chemistry at the Institut Químic de Sarrià (Barcelona) in 2004 under the supervision of Prof. S. Nonell. In 2005 she moved to the laboratory of Prof. J. Hofkens at the Katholieke Universiteit Leuven (Belgium) to learn single-molecule and super-resolution fluorescence microscopy. In 2008 she began her independent research career at the University of Edinburgh, where she started a new research program to develop methodology for super-resolution imaging of DNA. In February 2012 she moved to IMDEA Nanoscience as a Researcher and Ramón y Cajal fellow.

Research lines
- Super-resolution fluorescence microscopy of DNA: We develop new imaging methods specifically tailored to DNA, which allow a spatial resolution of tens of nanometers.
- Genetically-encoded singlet oxygen photosensitizers: The objectives of this research line are to understand singlet oxygen photosensitization by proteins, engineer new and better mutants, and use them in applications such as photodynamic therapy or electron microscopy.

Proteins as tools in nanotechnology

Dr. Begoña Sot
Researcher
PhD.: Universidad del Pais Vasco, Spain
Previous Position: Centro Nacional Biotecnología (CNBCSIC), Madrid, Spain

Dr. Sot did her PhD in Universidad del Pais Vasco, under the supervision of Prof. Arturo Muga, focused on the allosterism of chaperons. Then she worked with Prof. Alan Fersht (Centre for Protein Engineering, Cambridge) gaining knowledge in biophysical characterization of protein-protein interactions. Later she worked with Prof. Alfred Wittinghofer (MPI, Dortmund) studying the activation of G-proteins activity by protein-protein interactions and its regulation by co-localization. In 2011 she joined Prof. Jose Maria Valpuesta’s group (CNB-CSIC), where she learned Electron Microscopy techniques. Finally, she joined IMDEA in December 2012 as Ramón y Cajal fellow.

Research lines
- Use of proteins as tools in nanotechnology, specifically, protein engineering approaches for the design of new recognition modules and the development of nano-reactors with improved catalytic properties based on enzyme immobilization and co-localization.

Relevant publications
- “Ras GTPase activating (RasGAP) activity of the dual specificity GAP protein Rasal requires co-localization and C2 domain binding to lipid membranes”. Sot B et col., 2013 Proc. Nat. Acad. Soc. USA 110, 111-116

Pedro Lara
Internship
programme 5
nanoelectronics and superconductivity

This program mainly deals with Electric Transport in Nanosystems. Alternative approaches to the silicon-based semiconductor industry may involve devices based on graphene nanostructures or transport through single molecules. Chemical synthesis to tailor molecular structure and functionality (in connection with Program 1), systematic variation of temperature and/or vacuum conditions and theoretical computations are necessary complements to gain a wider perspective in molecular electronics. A second area of interest is Superconducting Nanostructures, i.e. mesoscopic superconductors fabricated as superlattices, nanowires or nanodots, where the way in which confinement and proximity phenomena between superconductors and materials with other properties (e.g. magnetic) is explored.

Prof. José Luis Vicent
Programme Manager
Double Affiliation: Universidad Complutense de Madrid, Spain

José Luis Vicent is professor of Physics in the Departamento de Física de Materiales (Universidad Complutense, Madrid) and Director of the Physical Techniques Center for Research Support (CAI Técnicas Físicas) of Universidad Complutense. Prof. Vicent has worked in the Physics Department at University of Virginia, F. Bitter National Magnet Lab. at MIT, Solid State and Materials Science Divisions at Argonne National Lab., Department of Physics at University California-San Diego, Centro Atómico Bariloche (Argentina), and Universidad del Valle (Colombia). He is Fellow of the American Physical Society, and member of the Royal Spanish Physical Society (RSEF), he has been secretary of its Publication committee, and Chairman of the Spanish Condensed Matter Division (RSEF, Real Sociedad Española de Fisica). Professor Vicent was the Chairman of the Materials Science Commission (Spanish National Science Foundation) and National Coordinator of the Materials Science Program (Spanish CICYT, Science & Technology Commission) 1993 – 1995. Prof. Vicent has been the advisor of more than 20 masters and Ph. D. graduate students. Prof. Vicent publications cover very different topics for example, a diversity of materials as single crystal layered compounds and metallic glasses, many different effects as superconducting vortex lattice dynamics, magnetic vortex dynamics, magneto-optical effects, superconducting critical current effects, and finally several low dimensional structures as high Tc superconducting oxide superlattices and metallic superlattices and so on.

Relevant publications

Research lines
Prof. Vicent have worked on many research fields, mainly on Superconductivity and Magnetism, for instance low dimensional superconductivity, superlattices, magnetic metallic glasses, fabrication of magnetic and superconducting nanostructures, high temperature superconductivity, nanomagnetism, superconducting vortex physics, and hybrid magnetic/superconducting nanostructures.
Electrical conductivity of single molecules

Dr. Teresa González
Researcher
Ph.D. Universidad de Santiago de Compostela, Spain
Previous Position: University of Basel, Switzerland

Teresa González graduated in Physics in 1996 at the University of Santiago de Compostela (Spain). She got her Ph. D. in 2003 at the same university, with a study on melt-textured high-Tc superconductors, which was awarded with the Premio Extraordinario de Doctorado. From 2004 to 2008 Dr. González was Research Assistant at Basel University (Switzerland) with Professor Christian Schönenberger. There, she worked on the electrical properties of single molecules in a MCBJ setup. She joined IMDEA-Nanociencia as a Ramón y Cajal research fellow in 2008.

Research lines
Molecular electronics: study of the electrical properties of single molecules using a scanning tunnelling microscope. She investigates different techniques to contact an individual molecule, and studies its properties under different conditions, at low and room temperatures. Currently her research is focused on different studies about compounds such as alkanes, oligo(phenyleneethynlenes), fluorenes, porphyrines and phthalocyanines; and different chemical binding groups such as thiols, amines or C60.

Relevant publications

Fabrication and properties of nanostructured superconductors

Dr. David Pérez de Lara
Researcher
Ph.D.: Istituto di Cibernetica del CNR, Italy / Instituto Nacional de Fisica Nuclear (INFN), Italy
Previous Position: Universidad Complutense de Madrid, Spain

Graduated in Theoretical Physics at UAM (1994), David Pérez de Lara got a PhD from UAM-IC-CNR in 2003. he has had positions at ESA/ESTEC (The Netherlands 2 years), Istituto di Cibernetica of the National Italian Research Council (IC-CNR), Italian Istituto Nazionale di Fisica Nucleare (INFN) (3 years), “Decoherence and Entanglement in Quantum Complex Systems (DEQUACS-INFM 1 year), Fondo per gli Investimenti della Ricerca di Base (FIRB) of the Italian Ministry (MUR 3 years) and Universidad Complutense de Madrid (3 years). He had joined IMDEA Nanociencia in 2010.

Research lines
The main research activity is focused on the nanofabrication, experiments at low temperatures and modelization of superconducting devices with magnetic nanoarrays. Vortex dynamics and ratchet effects in superconductors are some relevant topics under investigation. This investigation is related to the development of superconducting-magnetic hybrid electronic devices based on a controlled and directional vortex motion.

Relevant publications
Electrical transport in nanosystems

Prof. Nicolás Agrait
Associated Senior Scientist
Ph.D. UNED, Spain
Double Affiliation: Universidad Autónoma de Madrid, Spain

Nicolás Agrait got a Ph.D. in Physics from the UNED. He is Full Professor since 2007 at the Condensed Matter Physics Department of the UAM and Senior Associated Researcher at IMDEA-nanoscience. He is well-known for his pioneering work in quantum transport and forces in atomic-sized contacts and atomic chains, and has over 50 publications in peer-reviewed journals summing over 3,500 citations. Prof Agrait and collaborators have developed several novel local-probe systems for these measurements. They have very recently applied these techniques to single molecules successfully measuring transport and vibrational spectroscopy.

Research lines
- Transport through single molecules. Systematic study of transport properties at the single molecule level using STM.
- Atomically-thin crystals. Study of local mechanical and electronic properties of graphene and dichalcogenide crystals, using STM and AFM.
- Single molecule magnets. Study of the influence of substrate, including graphene and semiconducting atomically-thin crystals, on their magnetic properties using STM at low temperature.

Relevant publications
programme 6

nanosurfaces and nanodevices

This program aims at developing nano-fabrication techniques and addresses new challenges in materials processing, device design and integration, opening up in this way new opportunities for applications in areas such as biomedical technology, photonics, clean energy, water management or construction.

The program leverages on nanofabrication technologies and specially focuses on cost-effective scalable process to develop new surface structured materials, to add new functionalities, or to improve those of existing materials. The special competencies within the program include surface patterning techniques such as nano-imprint lithography, soft lithography, block copolymer lithography and patterning of molecular grafts.

Particular attention is presently directed towards the development of surfaces with self-cleaning or antibacterial functionalities. In the area of photonics the properties of nano-imprinted light-emitting structures are under investigation. Another area of research focuses on the development of microfluidics devices including integrated SERS sensors and bacteria arrays for toxicology tests.
Dr. Daniel Granados
Director of the Center for Nanofabrication

Dr. Daniel Granados joined IMDEA Nanoscience in September 2009. Since his arrival he has been in charge of the design and supervision of the construction works of the clean room that hosts the Centre of Nanofabrication. He has also been in charge of the acquisition and installation of the nanofabrication tools. Dr. Granados is currently the Director of the Centre of Nanofabrication. His expertise in micro and nanofabrication focuses on photonics and nano-optics devices. Recently he has started to fabricate electro-optical prototypes based on graphene and other 2D materials.

Dr. David Pérez de Lara
Researcher

Dr. David Pérez de Lara joined IMDEA Nanoscience in January 2010. Since his arrival he has been part of the micro and nanofabrication researchers’ team. He contributed to the installation of the optical and electronic lithography equipments. His expertise in micro and nanofabrication focuses on superconducting-magnetic hybrid electronic devices based on a controlled and directional vortex motion superconducting detectors and superconducting Josephson junctions.

Soft Robotics

Dr. Ramses V. Martínez
PhD: Universidad Autonoma de Madrid, Spain
Previous Position: Harvard University, USA

Dr. Ramsés V. Martínez obtained Bachelor’s and Master’s degrees in Physics at the Autonomous University of Madrid (UAM). In both cases he wrote a thesis on novel nanofabrication techniques under the supervision of Prof. Ricardo Garcia. During the last year of his PhD, he spent 3 months at the Department of Material Science and Engineering at Massachusetts Institute of Technology (MIT), participating in the activities of Prof. Stellacci’s research team. He has recently received a joint European doctoral degree in Physics from the Autonomous University of Madrid and the European Commission. He currently holds a three-year International Outgoing Fellowship (IOF) at Harvard University-IMDEA Nanociencia and works in the Whitesides’ research group (Nanofabrication Team).

Relevant publications
This Programme deals with the development of novel nanotechnologies for medical applications that will result in better, more efficient, and cost-effective therapeutic and diagnostic tools.

One of the important areas in this Programme is the preparation and use of magnetic nanoparticles in medicine, in particular for cancer treatment and diagnosis. Magnetic nanoparticles with optimized properties are used as powerful and minimally-invasive theranostic tools. Multifunctionalized magnetic nanoparticles selectively target tumors for multimodal treatment as drug nanocarriers and heating inductors, and sensitive imaging as contrast agents. This Programme is highly interdisciplinary, combining the wide range of expertises necessary to successfully develop this research from the nanoparticle synthesis to the pre-clinical applications.

Other area of interest is the use of nanotechnology-based solutions to the growing problem of antibiotic-resistant bacteria. Nanostructures with antibacterial properties that rely on different antibacterial mechanisms are being investigated as promising alternatives to antibiotics. Antibacterial and selective bacterial entrapping nanostructured surfaces are also under development.

The generation of sensors based on nanoparticles for detection of targets of medical interest is another area under study that aims to exploit the promise to offer higher sensitivity and specificity of the nanostructure-based diagnostics platforms.
Dr. A. L. Cortajarena earned her Ph.D. in Biochemistry from the Universidad del País Vasco in 2002. Then, she joined the group of Prof. L. Regan at Yale University, USA, as a Postdoctoral Fellow. She worked on protein design, structure, and function. In 2006, she was Visiting Scientist at the Weizmann Institute, Israel, working on single molecule spectroscopy. Then, continued her work at Yale University, as an Associate Research Scientist with Prof. Regan. She joined IMDEA Nanociencia as Group Leader in January 2010. Her research focuses on protein design toward the application of novel protein-based nanostructures in nanotechnology, and on the generation of biofunctional nanostructures and platforms and their applications in nanomedicine.

Research lines
- Bio-functionalization of magnetic nanoparticles for cancer treatment and diagnosis
- Polymer surface bio-functionalization for biosensors applications

- Self-assembly of designed proteins into ordered nanostructures and biomaterials

Relevant publications

Dr. Francisco Terán
Researcher
Ph.D.: Université Joseph Fourier-Grenoble I, France
Previous Position: Centro Tecnológico Gaiker, Fundación Gaiker, Spain

Graduated in Physics from the Universidad Autónoma de Madrid in 1997, Francisco Terán got a Ph.D. in Physics from the Université Joseph Fourier in 2001. Dr. Terán has performed research studies on spin and electronic properties of semi-magnetic semiconductor nanostructures at different international research centers and joined the Nanomagnetism Programme of IMDEA Nanoscience on April 2009. Since then, Dr. Terán is interested on the dynamical magnetic properties of iron oxide nanoparticles for biomedical applications.

Dr. Terán has more than 40 publications in international journals, and more than 25 invited and oral communications at international conferences.

Research lines
- Magneto-thermal and magnetic properties of superparamagnetic nanoparticles for biomedical applications
- Stimuli responsive polymeric surfaces
- Spin dynamics in semi-magnetic semiconductor nanostructures
- Optical properties of semiconductor nanostructures

Modified oligonucleotides in nanobiomedicine: RNA interference and sensors

Dr. Álvaro Somoza
Researcher
Ph.D.: Universidad Autónoma de Madrid, Spain
Previous Position: Instituto de Investigaciones Biológicas (IRB-Barcelona), Barcelona, Spain

Álvaro Somoza studied Chemistry at Universidad Autónoma de Madrid where he did his PhD, under the direction of Prof. Carmen Carreño, focused on the total synthesis of Rubiginones. He then joined the group of Prof. Eric Kool at Stanford University. There he worked on a project focused on the use of modified oligonucleotides to study the role of sterics and hydrogen bonding interactions in RNA interference. Later, he moved to Barcelona to work with Dr. Ramón Eritja at the IRB, where he started a project devoted to the study of the interactions between RNA strands and the protein involved in RNA interference. He is junior scientist at IMDEA since 2009.

Research lines
The research of Dr. Somoza is focused on the preparation of modified oligonucleotides functionalization of nanoparticles for different applications. Particularly, modified RNAs are prepared to study RNA interference and to modify gold nanoparticles to improve their delivery. On the other hand, DNA is used to assemble nanostructures for different applications such as sensors. In addition, gold and magnetic nanoparticles are modified with different linkers to ease their functionalization with different biomolecules or drugs for the treatment of cancer.

Synthesis of Magnetic Nanoparticles

Dr. Gorka Salas-Hernández
Researcher
Ph.D.: Universidad de Valladolid, Spain.
Previous Position: Laboratoire de Chimie Organométallique de Surface (CNRS), Lyon, France.

Gorka Salas obtained his PhD in Chemistry (2007) at the Universidad de Valladolid, under the supervision of Prof. Pablo Espinet and Juan A. Casares, working on the field of transition metal organometallic compounds and homo-
geneous catalysis. Then he joined the group of Bruno Chaudret and Karine Philippot at the Laboratoire de Chimie de Coordination (CNRS), in Toulouse, to work in the synthesis and application in catalysis of metal nanoparticles inionic liquids. This work continued in the group of Catherine C. Santini in Lyon (Laboratoire de Chimie Organométallique de Surface, CNRS). Since 2011 he works at IMDEA Nanociencia in the synthesis of metal oxide nanoparticles for biomedical applications, in close collaboration with the group of M. P. Morales (Instituto de Ciencia de Materiales de Madrid, CSIC).

Research lines
- Synthesis of magnetic nanoparticles with relevant properties for different applications, with special focus in biomedicine (as magnetic hyperthermia mediators, drug carriers and contrast agents for imaging). Nanoparticles are mainly based on iron oxides, although hybrid nanomaterials combining other transition metals are under research at the lab.
- Surface modification of the nanoparticles with functional molecules for different purposes. This research is mainly focused in the use of different coatings that provide biocompatibility and functionality to the nanoparticles and allow them to be used in biomedical applications.

Relevant Publications

Magnetic nanoparticles in biomedical applications

Dr. Daniel Ortega
Researcher
Ph.D.: University of Cádiz, Spain
Previous Position: University College London, United Kingdom

Daniel Ortega received both MSc and PhD degrees in 2003 and 2007 at the University of Cádiz, where he successfully developed transparent magnetic nanocomposites with application in magneto-optical sensors. He undertook his first postdoctoral position at the University of the Basque Country in 2008 researching unusual magnetic properties in metallic and diluted magnetic semiconductor nanoparticles. Starting in 2009, he joined the The Royal Institution of Great Britain and the Physics department at University College London, first as a Marie Curie postdoctoral fellow and thereafter as a research associate, to work in the field of healthcare biomagnetics. During this period he was awarded an honorary research associate position at the London Centre for Nanotechnology. He is focused in bespoke magnetic nanoparticles with applications in biomedicine and developing new instrumental methods for their characterisation. Working on the same topics, he was appointed to the Toyohashi University of Technology in 2013 for a short spell. Since late 2013 he joined IMDEA Nanoscience, also holding an honorary position at the UCL Institute of Biomedical Engineering.

Research lines
- Magnetic nanostructures for magnetic hyperthermia, tissue engineering and cell therapies.
- Nanoscopy techniques for magnetically modified cells and biological constructs.
- Next-generation magnetocaloric materials.

Magnetic nanoparticles in biomedicine. Cell-particle interactions

Prof. Ángeles Villanueva
Associated Senior Scientist
Ph.D.: Universidad Autónoma de Madrid, Spain
Double Affiliation: Universidad Autónoma de Madrid, Spain

Dr. Ángeles Villanueva is a cell biologist. Her research is mainly focused on photodynamic therapy of cancer. In the last years, she has established new collaborations with research groups in the field of magnetic nanoparticles with applications in Medicine. She has studied in cell cultures: i) the mechanisms of nanoparticles internalization; ii) their subcellular localization; iii) the nanoparticles biocompatibility; and iv) the identification the cell death mechanism induced by heat-controlled intracellular hyperthermia with magnetic nanoparticles and an alternating magnetic field.

20-24.03.2013
Second International Advanced Materials Science Networking (AMASING) Workshop, Da Nang, Vietnam
High-resolution friction force microscopy and applications to environmental issues
E. Gnecco & C. M. Pina

10.04.2013
245th ACS National Meeting, New Orleans, Louisiana, USA
Dye-Sensitized Solar Cells based on Metallophthalocyanines
T. Torres

12.04.2013
3rd Conference on Catalysis and Sensing for Environment (CASE), The University of Texas at Austin, Austin, USA
Photoactive Phthalocyanine and Subphthalocyanine-Based Ensembles
T. Torres

12-16.05.2013
223rd Meeting of the Electrochemical Society (ECS), Toronto, Canada
Organic Molecular Wires: Merging Through Space and Through Bond #,#-Coupling in [2,2’] Paracyclophane-o-PPV Wires
N. Martín
Organocatalysis in Fullerene Chemistry
N. Martín
Phthalocyanines and analogues as components of photovoltaic and artificial photosynthetic devices

20-24.05.2013
13th European Light Microscopy Initiative Meeting, Arcachon, France
Super-resolution fluorescence microscopy of DNA
C. Flors

22-23.05.2013
International Workshop on Hybrid Semiconductor Materials, University of Nicosia, Cyprus
Femtosecond probing of hybrid optoelectronic devices
Juan Cabanillas Gonzalez
24.05.2013
4th Georgian Bay International Conference on Bioinorganic Chemistry (CanBIC-4), Parry Sound, Ontario, Canada
Subphthalocyanines: Singular aromatic non-planar molecules
T. Torres

26-30.05.2013
96th Conference of the Canadian Society for Chemistry (CSC) Quebec, Canada
Optoelectronic Properties of Single Crystalline Conjugated Organic Materials
J. Gierschner

27-31.05.2013
E-MRS, Strasbourg, France
Thermo-responsive platforms with quantum dots and Au nanoparticles trapped by optical tweezers
Synthesis and optical studies
Beatriz H. Juárez

02-07.06.2013
11th International Symposium on Functional #-electron Systems, Arcachon, France
Tailoring Electroactive Molecular Tweezers for Carbon Nanotubes
N. Martín.

04.06.2013
Optical Tweezers in Life Sciences, Berlin, Germany
Single-molecule manipulation of RNA structures: double-stranded helices and G quadruplexes
J. Ricardo Arias-Gonzalez

02-07.06.2013
11th International Symposium on Functional #-electron Systems, Arcachon, France
Tailoring Electroactive Molecular Tweezers for Carbon Nanotubes
N. Martín.

26-28.06.2013
Supramolecular Functional Materials for Organic Electronics Conference ISIS, University of Strasbourg, Francia
Ordering Electroactive Small Molecules into Hierarchical Supramolecular Ensembles
N. Martín.

9-12.06.2013
XII Congreso Nacional de Virología, Burgos, Spain
New tools for the study of virus structure: Microscopies from atoms to cells.
J. López Carrascosa

01-05.07.2013
9th International Workshop on Magnetism and Superconductivity at the nanoscale Coma-ruga, Spain
Magnetic/superconducting hybrids: from percolation effects to wire network behaviors
J. L. Vicent

19.06.2013
Red de Excelencia NoE Nanophotonics for Energy, Madrid, Spain
Hybrid systems based on semiconductor nano-crystals
Beatriz H. Juárez

24-28.06.2013
11th European Conference on Atoms Molecules and Photons (11th ECAMP), Aarhus, Denmark
Charge transfer between molecules and metal surfaces covered with ultrathin insulating films
M. Robledo, S. Díaz-Tendero, F. Martín and M. Alcamí

19-21.06.2013
International Congress of the Spanish Biophysical Society. SBE, Valencia Spain
Instruct Integration Biology: a Structural Biology Initiative (Chair)
J. López Carrascosa
Macromolecular Complexes Session 9 (Chair)
J. López Carrascosa
The Structure of Native Influenza Virion Ribonucleoproteins
Jaime Martín-Benito, Rocío Arranz, Rocío Coloma, F. Javier Chichon and J. López Carrascosa
08-12.07.2013
4th Attosecond Physics Conference (ATTO 2013)
Paris, France
Correlated electron and nuclear dynamics in
strong field photoionization and high-harmonic
generation from the H$_2^+$ molecular ion.
F. Martín

08-09.07.2013
VI Workshop Nanociencia y Nanotecnología, Alcalá de Henares, Spain
Grafting Dyes on graphene/gold electrodes
Revenga-Parra, M, C. Anquela, J.M. Abad, F. Pariente, E. Lorenzo

13-17.07.2013
9th European Biophysics Congress, Lisbon, Portugal.
Supramolecular Assemblies (Chair)
J. López Carrascosa
Femtosecond crystallography: Dawn of a new era in structural biology (Chair)
J. López Carrascosa

24-30.07.2013
Congress: XXVIII International Conference on Photonic, Electronic, and Atomic Collisions (ICPEAC2013) Place: Lanzhou (China)
Ultrafast nonadiabatic fragmentation dynamics of biomolecules
M. Alcamí

28.07-02.08/2013
International Symposium on Novel Aromatics (ISNA-15) Universidad de Taipei, Taiwán
Electroactive Molecular Receptors for SWCNTs: #,#-ordering Motif
N. Martín.

17-20.08.2013
14th ISEAC, Chanchung, China
Nanomaterials for electrochemical sensing platforms
María Encarnación Lorenzo Abad

19.08.2013
International Conference on “Solar Energy for World Peace” Istanbul, Turkey.
Phthalocyanines for Molecular Photovoltaics
T. Torres

01-06.09.2013
6th International Workshop on Surface Physics, Niemzca (Poland)
Dynamical effects on the self-assembly of organic molecules on solid surfaces
R. Otero

03-06.09.2013
ALBA User Meeting, VI AUSE Conference, Barcelona, Spain
Cartography of a whole cell by cryo-synchrotron Xray nano-tomography
J.L. Carrascosa

09-13.09.2013
Trends in Nanotechnology 2013, Sevilla, Spain
Dynamical effects on the self-assembly of organic molecules on solid surfaces
R. Otero

15-18.09.2013
XXXIV Reunión Bienal de la Real Sociedad Española de Química, Santander, Spain
New Organic Materials for OPV
Juan Luis Delgado
Modified oligonucleotides in nanotechnology and nanomedicine
Álvaro Somoza
Chiral Fullerenes from Asymmetric Catalysis
N. Martín
12.10.2013
International Conference on Advanced Polymeric Materials (ICAPM) Mahatma Gandhi University, Kottayam, Kerala, India
Organic-Inorganic Hybrid Materials and Polymers based on Phthalocyanines for Molecular Photovoltaics
T. Torres

21-27.10.2013
2013 EMN Open Access Week Chengdu, China
Dynamical effects on the self-assembly of organic molecules on solid surfaces
R. Otero

04-06.11.2013
ITAMP Workshop on ultrafast atomic and molecular physics with cutting-edge light sources: New opportunities and challenges, Manhattan, Kansas, USA
Clocking ultrafast wave packet dynamics in molecules through UV-induced symmetry breaking
F. Martín

04-08.11.2013
58th MMM 2013 Denver, USA
Imaging magnetization reversal of interfacial exchange coupling

18-19.11.2013
First Joint CSIC-CNRS Workshop “Nanomaterials for Health”, Madrid, Spain
Identification of a list of topics for bilateral collaborations
G. Salas

21-22.11.2013
User Workshop at Extreme Light Infrastructure-Attosecond Light Pulse Source (ELI-ALPS), Szeged, Hungary
Clocking ultrafast molecular dynamics by using XUV-pump/XUV-probe schemes.
F. Martín

24-27.11.2013
9th Korea-Japan Symposium on Frontier Photo-science (KJFP) Seoul, Korea
Photophysics in Conjugated Organic Materials by Design: Intra- & Intermolecular Structural Motifs and Solid State Morphology
J. Gierschner
3.2.1. Regular contributions

31.01.-02.02.2013
4th Symposium on Computing pi-Conjugated Compounds (CPIC), Marseille, France

Oral Contribution
Tailor-Made Highly Luminescent and Ambipolar Transporting Organic Mixed Stacked Charge-Transfer Crystals
J. Gierschner

02-07.02.2013
Photonics West, San Francisco, USA

Oral Contribution
Fluorescent proteins as singlet oxygen photosensitizers: mechanistic studies in photodynamic inactivation of bacteria
Ruiz-González R, White JH, Cortajarena AL, Agut M, Nonell S, Flors C

04-05.02.2013
3rd Strategic Japanese-Spanish Cooperative Program on Nanotechnologies and new materials for environmental challenges Universidad de Tsukuba, Tsukuba, Japón

Oral Contributions
Endofullerenes for Photovoltaic Devices
N. Martín
Asymmetric Synthesis of Fullerenes
N. Martín

07-11.04.2013
245th ACS National Meeting (Graphene Meeting) American Chemical Society (ACS), New Orleans, USA

Oral Contribution
Towards electroactive graphene by chemical modification
N. Martín

14-18.04.2013
International BioIron Society Annual Meeting 2013 London, UK

Poster Contribution
Iron bioavailability from ingested iron oxide nanoparticles
S. Chamorro, A. Brenes, A. Viveros, C. Romero, L. Gutiérrez, G. Salas, Y. Luengo, M.P. Morales, and F. J.Teran

23-26.04.2013
TD-DFT Conference, Nantes, France

Poster Contributions
Td-DFT molecular dynamics simulations on the fragmentation of doubly charged methionine
Yang Wang; Dang Trinh Ha; Michael Huels; Eero Itälä; Kuno Kooser; Samuli Urpelainen; Edwin Kukk; Manuel Alcamí; Fernando Martín
05-10.05.2013
Gordon Research Conference, Lucca, Italy

Oral Contribution
Viruses and Cells “Building the viral replication organelle by a double stranded DNA virus.

12-17.05.2013
223rd Electrochemical Society Meeting (ECS) Electrochemical Society Inc. Toronto, Canadá

Oral Contributions
Supramolecular Chemistry of Carbon Nanostructures: Concave-convex Interactions
N. Martín.

Towards electroactive graphene by chemical modification
N. Martín.

27-31.05.2013
European Materials Science Society (E-MRS) Spring Meeting 2013, Strasbourg, France

Poster Contribution
Biocompatible small-molecule coatings for iron oxide magnetic nanoparticles prepared via thermal decomposition
Gorka Salas and M. Puerto Morales

Oral Contribution
Synthesis and optical trapping of individual thermo-responsive beads with colloidal quantum dots and Au nanoparticles
S. Hormeno, H. Lange, J.R. Arias-Gonzalez and B.H. Juarez

12.06.2013
Workshop on Chemistry and Molecular Imaging (ICMM-CNIC), Madrid, Spain

Oral Contribution
Assessing magnetic nanoparticle cytotoxicity
Gorka Salas

16-19.06.2013
XVIII Reunión SEQA, Ubeda, Jaen, Spain

Oral Contribution
Grafting of Azure A on gold electrodes for sensing applications
C. Anquela, M. Revenga-parra, J. M. Abad, F. Pariente, E. Lorenzo

16-21.06.2013
Gordon Research Conference, Proteins Plymouth,, NH, USA

Poster Contribution
Self-Assembly of repeat protein scaffolds into fibers and monolayers
S.H. Mejias; M.A. Garcia; S. Casado; J.M. Abad; A.L. Cortajarena.
19-21.06.2013
IX Meeting on Nucleic Acids and Nucleosides, Mieres, Spain

Oral Contributions
Mechanical Identities of RNA and DNA Double Helices Unveiled at the Single-Molecule Level

DNA Stabilized Gold Nanoparticles as delivery system
Alfonso Latorre Lozano; Christian Posch; Susana Ortiz; Alvaro Somoza

24-28.06.2013
Congress: 11th European Conference on Atoms Molecules and Photons (11th ECAMP), Aarhus, Denmark

Poster Contribution
Fragmentation dynamics of excited ionized polycyclic aromatic hydrocarbons

30.06-05.07.2013
Biological Surfaces and Interfaces, FEBS workshop, Sant Feliu, Spain

Poster Contribution
Self-assembly of designed repeated proteins into ordered monolayers and solution polymers
S.H.Mejías; S. Casado; J.M. Abad; B. Sot, A.L. Cortajarena.

03-07.07.2013
ICMAT 2013 Suntech City, Singapore

Oral Contribution
Effect of oxygen on the primary photoevents of P3HT:PCBM blends
Larry Lueer, R. Sai Santosh Kumar, T. Sauermann, H-J. Egelhaaf, G. Lanzani

Poster Contribution
Self-assembly of designed repeated proteins into ordered monolayers and solution polymers
S.H.Mejías; S. Casado; J.M. Abad; B. Sot, A.L. Cortajarena.

08-09.07.2013
VI Workshop Nanociencia y Nanotecnología, Alcalá de Henares, Spain

Oral Contributions
PH-dependant optical properties of dye-gold nanoparticle hybrid system
Iria Bravo, M.Revenga-Parra, T.Garcia, F.Pariente, J.M. Abad, E.Lorenzo

Electrochemically generated Pt-Pt nanostructures
11-13.07.2013
24 Reunión Bienal de Química Orgánica Universidad de San Sebastián, San Sebastián, País Vasco, España

Oral Contribution
Supramolecular Chemistry of Carbon Nanostructures: Concave-convex Interactions
N. Martín.

14-19.07.2013
Optical Probes of Conjugated Polymers and Organic Nanostructures, Durham, England

Oral Contributions
Tuning of Optical & Photophysical Properties in Single Crystals of pi-Conjugated Compounds
J. Gierschner

Optical and Vibrational Properties of Highly Emissive Substituted Dicyanodistyrylbenzene Single Crystals
S. Varghese, B. Milián-Medina, Johannes Gierschner, Reinhold Wannemacher

15-19.07.2013
XXXIV Biannual Meeting of the Spanish Royal Society of Physics, Valencia, Spain

Oral Contribution
A Maxwell’s demon that replicates genetic information
J.R. Arias-Gonzalez

Poster Contribution
Self-assembly of designed repeated proteins into ordered monolayers and solution polymers
S.H.Mejías; S. Casado; J.M. Abad; B. Sot, A.L. Cortajarena.

19-22.07.2013
XXIII International Symposium on Ion Atom Collisions (ISIAC 20139, Beijing, China

Poster Contribution
Collisions of ions with clusters of fullerenes: decay pathways and covalent bond formations

21-26.07.2013
26th International Conference on Photochemistry, Leuven, Belgium

Oral Contribution
Singlet oxygen generation by the genetically-encoded tag miniSOG
Ruiz-González R, Cortajarena AL, Mejias SH, Agut M, Nonell S, Fiors C

Poster Contributions
Direct measurement of phi29 phage stiffness provides evidence of internal pressure.

Mechanical Identities of RNA and DNA Double Helices Unveiled at the Single-Molecule Level
Elías Herrero-Galán, María Eugenia Fuentes-Pérez, Carolina Carrasco, José M. Valpuesta, José L. Carrascosa, Fernando Moreno-Herrero and Ricardo Arias-González
24-30.07.2013
XXVIII International Conference on Photonic, Electronic and Atomic Collisions (ICPEAC 2013), Lanzhou, China

Poster Contributions
Fragmentation dynamics of doubly charged methionine and alanine molecules induced by core photoionization
Yang Wang, Dang Trinh Ha, Estefanía Rossich, Michael Huels, Itäläz, Kuno Kooser, Samuli Urpelainen, Edwin Kukk, Manuel Alcamí, Fernando Martin

04-08.08.2013
EMBO Harden Conference. Helicases and nucleic acid translocases, Cambridge, UK

Poster Contributions
Translocation dynamics of a ‘hybrid DNA polymerase-helicase’ level
Morín, J.A., Cao, J.M. Lázaro, F.J, Valpuesta, J.M., Salas, M., Carrascosa, J.L., Ibarra, B.

25-30.08.2013
JEMS 2013 Joint European Magnetic Symposia Rhodes, Greece.

Oral Contributions
Origin of the Anisotropic GMR in Magnetic Multilayers

Imaging magnetization reversal of interfacial exchange coupling

Highly efficient heat dissipation in monodisperse iron oxide nanoparticles

Poster Contributions
Field-induced reduced coercivity and positive exchange bias in co/mnf2 bilayers

Simultaneous study of magnetization reversal and magnetoresistance in uniaxial magnetic anisotropy systems

25-30.08.2013
Sol-Gel 2013. Madrid, Spain

Oral Contribution
Thermo-responsive platforms with quantum dots and Au nanoparticles trapped by optical tweezers
Synthesis and optical studies
Beatriz H. Juárez

02-06.09.2013
European Society for Photobiology Congress, Liège, Belgium

Oral Contribution
Singlet oxygen generation by the genetically-encoded tag miniSOG
Ruiz-González R, Cortajarena AL, Mejias SH, Agut M, Nonell S, Flors C

04.09.2013
12th European Conference on Molecular Electronics ECME-2013, London U. K.

Oral Contributions
Polyfluorene based rib waveguides for chemical sensing applications
Gonzalo del Pozo, Marta Mróz, Ramón Bernardo, Daniel Granados, Yan Qian, Ruidong Xia, Nouredinne Benis, Jose Manuel Otón, Xabi Quintana, Beatriz Romero, and Juan Cabanillas Gonzalez
A Detailed Study into the Properties of C60 Dumbbell Electrical Junctions
E. Leary; M. T. González; C. Evangeli; G. Rubio-Bollinger; N. Agraït.

Stability and breakage mechanism of molecular junctions based on different anchoring groups
M. T. González; E. Leary; A. Díaz; C. Evangeli; G. Rubio-Bollinger; N. Agraït

Features of the magnetization reversal mechanisms in the magnetoresistive response of magnetic nanostructures

Nanospectroscopy On FeCu Magnetic Alloy Films: Electronic Interface Effects In Organic-Metal Films

09-13.09.2013
Donostia International Conference on Nanoscaled Magnetism and Applications (DICNMA) Donostia (Spain)

Oral Contributions

Origin of the anisotropic gmr in magnetic multilayers

Imaging Magnetization Reversal Of Interfacial Exchange Coupling

Field-induced reduced coercivity and positive exchange bias in CoMnF bilayers

Simultaneous study of magnetization reversal and magnetoresistance in uniaxial magnetic anisotropy systems

09-13.09.2013
19th International Vacuum Conference, Paris, France

Oral Contributions

Intercalation of lead in graphene on Ir(111)
F. Calleja, S. Barja, M. Garnica, A.L. Vázquez de Parga and R. Miranda

Kondo resonance and inelastic tunneling spectroscopy on individual TCNQ molecules deposited on nanostructure graphene
M. Garnica, D. Stradi, F. Calleja, S. Barja, C. Díaz, M. Alcamí, N. Martín, A.L. Vázquez de Parga, F. Martín and R. Miranda

Elastic response of graphene nanodomes

Electron localization on periodically rippled graphene

Oligomerization of TCNQ-type Electron Acceptors via Unprecedented Surface-Assisted Decyanation Reaction

Features of the magnetization reversal mechanisms in the magnetoresistive response of magnetic nanostructures
Nanospectroscopy on ferrous magnetic alloy films: electronic interface effects in organic-metal films

Poster Contribution
New organic interactions at solid surfaces controlled by charge transfer
Koen Lauwaet, Jonathan Rodríguez Fernández, Raúl García, M. Ángeles Herranz, Nazario Martín, José M. Gallego, Roberto Otero, and Rodolfo Miranda

Oral Contributions
Stability and breakage mechanism of molecular junctions based on different anchoring groups
M. T. González; E. Leary; A. Díaz; C. Evangelí; G. Rubio-Bollinger; N. Agraït

15-18.09.2013
XXXIV Reunión Bienal de la Real Sociedad Española de Química, Santander Spain

Oral Contributions
Modification superficial, con moléculas pequeñas, de nanopartículas magnéticas obtenidas por descomposición térmica
Gorka Salas, Francisco J. Terán and M. Puerto Morales

Peptide functionalization of magnetic nanoparticles for cancer detection and/or hyperthermia treatment.

Peptide functionalization of magnetic nanoparticles for cancer detection and/or hyperthermia treatment
P. Couleaud, A. Latorre, A. Aires, G. Salas, M. Calero, M. Morales, Á. Somoza, Á. Villanueva, A. Cortajarena

Poster Contribution
DNA Stabilized Gold Nanoparticles as delivery system
Alfonso Latorre Lozano; Christian Posch; Susana Ortiz; Alvaro Somoza

17-20.09.2013
Microscopy at the Frontiers of Science 2013, Tarragona, Spain

Oral Contributions
Qualitative and quantitative analysis of Fe magnetic nanoparticles designed for antitumoral therapy

Vaccinia Virus (VACV) development inside infected cells by soft X-ray tomographic reconstruction.

Poster Contribution
Structural characterization of the Phi29 Tail complex During DNA Injection
F.J. Chichón, A. Cuervo, J.J.Conesa, A. Camacho and J.L.Carrascosa

22-28.09.2013
IUMRS-ICAM2013 International Conference on Advanced Materials Qingdao, China

Oral Contributions
Nanoscale Perpendicular Magnetic Dot Arrays Fabricated by Extreme Ultraviolet Interference Lithography (EUV-IL)
F. Luo, L. J. Heyderman, H. H. Solak, T. Thomson

30.09-04.10.2013
Nanoimprint and nanoprint 2013 (NNT2013), Barcelona, Spain

Poster Contributions
Bioinspired super-hydrophobic self cleaning surfaces from hierarchically assembled templates
Audrey Yoke Yee Ho, Emma Luong, Hong Yee Low, Isabel Rodríguez, Chee Tiong Lim, Sriiram Natarajan, Noha Elmouelhi, Murty Vyakarnam, Kevin Cooper
08-09.10.2013
Bio-inspired nanotechnologies Leipzig, Germany
Oral Contribution
Self-assembly of repeat proteins scaffolds into ordered films, fibers and monolayers
Aitziber L. Cortajarena

08.-11.10.2013
Excited States and Complex Environments Münster, Germany
Poster Contributions
Modeling of Optical Properties of Conjugated Oligomers & (Co)Polymers: How accurate is TD-DFT?
M. Wykes

11-12.10.2013
Encuentro Multidisciplinar de Neurooncología Española 2013, Pamplona, Spain.

11.10.2013
International Symposium on New Materials Trieste University, Italia
Oral Contribution
Enantioselective Prato Reaction
N. Martín

24.10.2013
The Irago Conference, Tahara, Japan
Poster Contributions
Innovative capsule for measuring aqueous samples by transmission electron microscopy

27.10-01.11.2013
AVS 60th International Symposium and Exhibition, Long Beach, California (E.E.U.U.)
Oral Contribution
Evidence of long range magnetic order in a purely organic 2D layer adsorbed on epitaxial graphene
M. Garnica, D. Stradi, S. Barja, F. Calleja, C. Díaz, M. Alcamí, N. Martín, A.L. Vázquez de Parga, F. Martín, R. Miranda

04-08.11.2013
58th MMM 2013 Denver, USA
Oral Contribution
Origin of the anisotropic gmr in magnetic multilayers

06-09.11.2013
X Simposio de Investigadores Jóvenes RSEQ-Sigma Aldrich Madrid, Spain
Oral Contribution
DNA Stabilized Gold Nanoparticles as delivery system
Alfonso Latorre Lozano; Christian Posch; Susana Ortiz; Alvaro Somoza

10-12.12.2013
6th International Summit on Organic Photovoltaic Stability Aix-les-Bains, FR
Poster Contributions
Modeling of Optical Properties of Conjugated Oligomers & (Co)Polymers - Concepts and Methods
M. Wykes
3.3. Workshops & Courses (Co)-
Organized by IMDEA-Nanociencia

03-07.02. 2013
XIV Escuela Nacional de Materiales Moleculares,
Almagro, España
http://www.icmol.es/XIVENMM/

Células Solares Orgánicas e Híbridas
J.L. Delgado
Más allá del grafeno: Polímeros bidimensionales sintéticos.
F. Zamora

16.-17.02.2013
Workshop on Molecular Electronics, Madrid, Spain
Structure-Property Control in Conjugated Organic Materials for Optoelectronic Applications
J. Gierschner
High conductance metal-organic nanostructures.
F. Zamora

14.-16.05.2013
Workshop Molecular Interactions - Atoms to Networks. Rice University, Huston, USA

Physics of Living Systems Network
A.L. Cortajarena

05.06. 2013

**ImaginDNA**

“Advanced DNA imaging: improving spatial resolution and contrast through photoswitching”

**Funding:** FP7-PEOPLE-2011-CIG nº 303620  
**Duration:** 2013-2017  
**Principal Investigator:** Dr. Cristina Flors

Fluorescence photoswitching constitutes the core of the recently developed “super-resolution” imaging techniques, which are able to improve spatial resolution in fluorescence microscopy beyond the diffraction limit of light. Recent advances in fluorescence photoswitching have also impacted the development of other microscopy techniques such as optical lock-in detection (OLID) imaging. OLID imaging uses fluorescence photoswitching to improve image contrast, instead of spatial resolution. To fully realize the great potential of these advanced imaging methods, novel strategies to label cell components with photoswitchable fluorophores in high density are needed. This project aims at developing new and better ways to engineer fluorescence photoswitching in DNA. Different strategies to introduce desirable properties such as reversible fluorescence photoswitching, high labelling density and control over DNA sequence will be developed throughout the project.
SolarRevolution

“Revolutionizing Understanding of Organic Solar Cell Degradation to Design Novel Stable Materials”

Funding: FP7-PEOPLE-2012-IEF nº 331795
Duration: 2013-2015
Principal Investigator: Dr. Michael Wykes

SolarRevolution aims to revolutionize the understanding of bulk-heterojunction organic solar cell (OSC) degradation by developing a detailed knowledge of the chemical and physical processes involved. This knowledge will be applied to the rational design of novel materials to give OSCs 20-year lifetimes and allow mass-market uptake of this low-cost, low-energy-footprint, transparent, lightweight and flexible technology. Quantumchemical modelling of degradation mechanisms will provide detailed and experimentally-inaccessible insight. This will dramatically enhance the clarity and robustness of experimental conclusions, leading to a deeper understanding of OSC degradation. Diffusion of oxygen into OSCs and the subsequent photochemical reactions represent the dominant source of degradation of the photoactive layer. Quantum-chemical calculations will characterize the chemical species and photochemical reactions involved in degradation. Semiclassical models will reveal how degraded materials impact exciton and polaron dynamics, and hence OSC efficiency. Finally, our new understanding of degradation will be exploited in the design and in-silico screening of novel materials for stable OSCs. Close collaborative links with leading academic and industrial groups will be forged via host-participation in the pan-European OSC research project ESTABLIS (FP7-ITN-290022). Two-way knowledge-transfer under strict IP control will: i) provide SolarRevolution with state-of-the-art materials and experimental data, and ii) allow hypotheses and novel material designs generated by SolarRevolution to be experimentally verified and industrially trialled. This will ensure that SolarRevolution will be well-positioned to contribute to high-impact publications and patent filings, raising Europe’s profile in OSC research and establishing the fellow, Michael Wykes, as a leading researcher in the field.
XUV/X-ray light and fast ions for ultrafast chemistry (XLIC)

**Funding:** European Science Foundation. CMST COST Action CM1204  
**Duration:** 2013-2017  
**Chair of the Action:** Manuel Alcamí

The use of novel light sources and fast ions is opening new avenues in the study of chemical reactivity. XUV/X-ray pulses with attosecond duration permit to “visualize” the movement of electrons inside a molecule and a much better control of chemical reactions. X-ray Free Electron Lasers, synchrotrons or collision with fast ions can be used to generate molecules in highly excited and highly charged states that present new and unexpected reactivity.

The study of molecules under these extreme intensities and time resolution conditions requires new theoretical models that can serve as guidance for experiments. The scientific objective of the is to understand, monitor and control the complex ultrafast electronic and nuclear dynamics that occur in medium-sized and large molecules, to develop new control strategies of reactions and to develop a new generation of ultrafast spectroscopies combining attosecond temporal and sub-Angstrom spatial resolutions.

This is an interdisciplinary field in which European groups are very active but work separately. COST is thus the perfect framework to enhance exchange of knowledge, bringing together leading experts in generating, manipulating and modeling these new phenomena. The collaboration between groups will reinforce the European leadership in XUV/X-ray-, attosecond-, synchrotron- and ion-based research in chemistry.

---

NanoSpectroscopy

**Funding:** European Science Foundation. MPNS COST Action MP1302  
**Duration:** 2013-2017  
**Participants:** Dr. Johannes Gierschner & Dr. Cristina Flors

With today's research and industry aiming for ever smaller objects and feature sizes, there is an increasing demand for spectroscopic methods to investigate processes, objects, and material properties with unprecedented spatial and temporal resolution as well as chemical specificity. The new insights are important for issues such as understanding life on the (sub-)cellular level, light-matter-interaction, light-to-energy conversion, or materials engineering. The interdisciplinary approach of nanospectroscopy encompasses the fields of Physics, (Bio-)Chemistry, Biology, Medicine, Nanotechnology, and Materials Science.
Optical nanospectroscopy uses methods such as confocal and/or ultrafast Raman and fluorescence spectroscopy for the detection and spectral analysis of objects at the nanoscale, down to the single-molecule level. In this Action, nanospectroscopic techniques will be applied to tailored materials and nanostructures (organic/inorganic, semiconducting, metallic, hybrid, bio) to gain deeper understanding of nanoscale processes.

COST NanoSpectroscopy aims at consolidating European expertise on all aspects of UV/Vis/NIR nanospectroscopy (modelling, experiment, nanostructures, materials, equipment, applications) into one coherent Action. The COST networking approach is particularly well suited for this purpose. A training program will be established to spread the know-how of applying nanospectroscopic techniques and the gained insights. In dialogue with European industry, nanospectroscopic techniques will be further developed, e.g. as applied techniques for non-specialists.

http://www.cost.eu/domains_actions/mpns/Actions/MP1302

Understanding and Controlling Nano and Mesoscale Friction

**Funding:** European Science Foundation. MPNS COST Action MP1303

**Duration:** 2013-2017

**Participants:** Dr. Enrico Gnecco

Recent years have seen widespread efforts to understand the mechanisms of friction and tribology in micrometric structures (mesoscale) down to the realm of atoms and molecules (nanoscale) with the ultimate goal of controlling friction, adhesion and wear by design. This research has generated an interdisciplinary scientific area, nanotribology, with great potential impact on technology and everyday life. Applications include safety, economy, life quality, energy and material saving, toward a sustainable development. Europe has a strong scientific nanotribology community spreading over physics, materials science, chemistry, earth and life sciences.

The goal of this COST Action, operating beyond the national horizons, is to mobilize and put together the critical mass of existing human and technical nanotribology resources at a modest price, thus representing a unique opportunity for an efficient scientific investment. IMDEA Nanociencia will have a leading role in this Action, since an IMDEA Senior Researcher, Dr. Enrico Gnecco, will be one of the two Spanish representatives in the Management Committee of the Action. The research topics currently investigated by his group (nanoscale friction in liquid environments, manipulation of nanoparticles by scanning probe microscopy, influence of mechanical vibrations on friction and nanomanipulation, modeling atomic-scale friction and nanomanipulation) will greatly benefit from the interactions which will be established by this project and other groups at IMDEA Nanociencia may join the initiative in the near future.
In summary, the MP1303 COST Action aims to promote conferences, short-term scientific exchanges, training schools and common publications within the 14 countries participating in the project (Austria, Denmark, Finland, France, Germany, Ireland, Israel, Italy, Netherlands, Portugal, Spain, Switzerland, Turkey and United Kingdom). The Action is expected to end in May 2017.

**NANOPYME**

“Nanocrystalline Permanent Magnets Based on Hybrid Metal-Ferrites”

**Funding:** FP7-NMP-2012-SMALL-6 nº 310516  
**Partners:** Consortium of 11 European partners coordinated by IMDEA Nanociencia  
**Duration:** 2012-2015  
**Coordinator:** Dr. Alberto Bollero  
http://nanopyme-project.eu/

Permanent magnets are key elements of technological devices used in motors, generators, information storage and many more nowadays applications. E.U. industries depend critically on the production of such type of magnets which are based on rare-earths metals. However most of the mines and reserves of rare-earths are controlled by emerging countries (mainly China) that started recently to develop their own technological devices instead of simply exporting the raw materials. Moreover E.U. companies do not produce rare-earth magnets. Rare-earths represent the group with the highest supply risk.

NANOPYME addresses the design and development of permanent magnets without rare-earths, consisting on hybrid nanostructures based on metals and ferrite oxides. Project relies on key advances in the fields of nanoscience, materials fabrication and processing. These newly designed rare-earth free permanent magnets will guarantee their use in a broad spectrum of technological applications which are currently covered by more expensive low energy-range rare-earth permanent magnets. This is crucial in order to allow E.U. technological companies to be competitive in the global market.
PHOCS
“Photogenerated Hydrogen by Organic Catalytic Systems”

Funding: FP7-ENERGY-2012-1-2STAGE nº 309233
Partners: Consortium of 7 European partners coordinated by the Fondazione Istitute Italiano di Technologia, Geneve, Italy
Duration: 2012-2015
Principal Investigators: Dr. Nazario Martin & Dr. Juan Luis Delgado

Aim of the project “Photogenerated Hydrogen by Organic Catalytic Systems (PHOCS)” is the realization of a new-concept, photoelectrochemical system for hydrogen production, based on the hybrid organic/inorganic and organic/liquid interfaces. PHOCS takes the move from the recent demonstration of reduction/oxidation reactions taking place, under visible light and at zero bias, at the interface of an organic semiconductor and an aqueous electrolyte, obtained by the coordinator’s group. PHOCS intends to combine the visible-light absorption properties of organics, together with the enhanced charge transport capabilities of inorganic semiconductors, in order to build a hybrid photoelectrode for hydrogen generation. New organic donor and acceptor materials (conjugated polymers and fullerenes derivatives) will be synthesized, properly tuning HOMO-LUMO levels position and energy gap extent for semi-water splitting purposes. Final aim of PHOCS project is the realization of a solar-to-hydrogen energy conversion efficient device, as a tangible first step towards the new “organic water splitting” technology.

(Left) Schematic of the hybrid organic/inorganic water splitting system. The visible light sensitive polymer is put directly in contact to an aqueous electrolyte and coupled the nanostructured inorganic semiconductor electrode. (Right) Representative energy level diagram for the final hybrid, photoelectrolytic device.
POCAONTAS
“Polymer-Carbon Nanotubes Active Systems for Photovoltaics”

Funding: FP7-PEOPLE-2012-ITN nº 316633
Partners: Consortium of 9 European partners coordinated by IMDEA Nanociencia.
Duration: 2012-2016
Coordinator: Dr. Larry Luer

The goal of the POCAONTAS network is to offer training opportunities to 14 research fellows in the field of organic solar cells based on blending organic materials with carbon nanotubes. Polymer-Carbon Nanotubes Active Systems for Photovoltaics (POCAONTAS) is a training network coordinated by IMDEA Nanoscience that brings together top European players in the field of Organic Solar Cells (OSC) offering a unique opportunity for research career development. POCAONTAS will train a total of 14 researchers in the development of highly efficient and stable OSC based on tailored blends of polymers with single wall carbon nanotubes (SWNT) that are well suited for OSC due to their inherent extremely high stability, high carrier mobility and tunability of optical gaps.

ESTABLIS
“Ensuring STABiLity in organic Solar cells”

Funding: FP7-PEOPLE-2011-ITN nº 290022
Partners: Consortium of 9 European partners coordinated by the University of Pau and the Pays de L’Adour, France.
Duration: 2012-2015
IMDEA Research Team: Dr. Larry Luer
http://www.project-establis.eu/

The ITN ESTABLIS will train a team of 11 PhD Fellows and 4 Postdoctoral Fellows Establis in the development of materials and techniques for cheap, flexible and stable organic solar cells (OSCs). The task of IMDEA within the EU network ESTABLIS is to understand how degradation in organic solar cells influences the photovoltaic event chain, that occurs on time scales from 100 fs (charge transfer) up to microseconds (charge extraction).

Consequently, the first step was to build up and optimize our main research tools: microsecond pump-probe spectroscopy, photo-induced absorption spectroscopy and femtosecond spectroscopy. The set-up for microsecond pump-probe spectroscopy has now a noise level in the 10^-7 region, and is thus internationally competitive. Moreover, a set
up for time resolved photovoltage has been built up, in order to benchmark electrical and optical information from the solar cells under study. One of our aims is to understand why oxygen reduces OSC’s efficiency. Fig. 1 shows how the presence of oxygen reduces the extraction of charge carriers in OSCs.

Fig. 1. Optical detection of charge carriers in an organic solar cell under short circuit (SC) conditions via their induced absorption (negative differential transmission, \( \Delta T/T \), at 980nm. A highly efficient pristine solar cell (black curve) does not accumulate charges at all, because of efficient extraction. After oxygen sorption (red curve), a strong charge accumulation is found after light on at 0 µs, clearly showing that extraction is no longer complete. The process is partially reversible after annealing in vacuum (Vac2) (green and blue curves). Karuthedath, et al., to be published.

MINT
“Mechanically Interlocked Carbon Nanotubes”

Funding: ERC-2012-StG_20111012 nº 307609
Duration: 2012-2017
Principal Investigator: Dr. Emilio Pérez

We present a plan to design, synthesize and exploit the properties of mechanically interlocked carbon nanotubes (MINTs). The scientific aim of the project is to introduce the mechanical bond as a new tool for the derivatization of carbon nanotubes. The mechanical link combines the advantages of covalent and supramolecular modifications, namely: kinetic stability (covalent) and conserved chemical structure (supramolecular). Besides this, its dynamic nature opens up unique opportunities for both fundamental studies and applications. From a technological point of view, MINTs should have a practical impact in the fields of molecular electronics and molecular machinery. A general
modular approach to MINT-based materials for photovoltaic devices and electrochemical sensors is presented. We also expect to exploit the rigidity and low dimensionality of SWNTs to construct molecular machines that utilize them as tracks to move across long distances, which is not possible in small-molecule molecular machines. To achieve these goals we will exploit the PI’s expertise in the chemical modification of carbon nanostructures, the self-assembly of electroactive materials and the synthesis and characterization of mechanically interlocked molecules.

**NANOTEST**

“Fabrication and development of nanotoxicology-test bacterial arrays for the investigation of antibiotics against multi drug-resistant bacteria”

**Funding:** FP7-PEOPLE-2010-IOF nº 275148  
**Duration:** 2012-2015  
**Principal Investigator:** Dr. Ramses V. Martinez

Bacterial resistance to antibiotics is one of the most important problems to be solved in medicine. Most antibiotics are effective against 99.9% of the target microorganisms. However, the remaining ones carry mutations that allow resistance against that particular drug which are transmitted to their progeny, making them immune to the treatment. Therefore, new strategies are necessary for the design of antibiotics able to circumvent bacterial resistance.

During the last decade we have developed many nanoscale systems to effectively transport drugs whose efficiency has not been properly evaluated due to the lack of a reliable technique for individually confining microbes. During the last year, our research has been focused on the development of a new toxicological test based on individual confinement bacteria. We have developed microfluidic systems for microbiology applications using soft lithography. By combining micro-printing of bacteria with microfluidic devices a new generation of toxicology tests for bacteria have been developed (See Figure 1) which will help to study the toxicological effects of certain medications using nanoparticles with small bacterial colonies.

In order to deposit small bacterial colonies on a flat substrate (sealed by the microfluidic system) the microcontact printing (MCP) technique will be used. Subsequently, the devise will be closed by inserting a number of microfluidic channels which then will be used to flux different concentrations of antibiotic to establish its toxological effect on the printed bacteria.
At present, the research is focused on testing the proper periodicity of the microfluidic channels, to maximize the interaction of the printed bacteria (currently, the E.coli AW405 strain) with different fluids introduced in the microfluidic device.

**Figure 1.** Left: Method for the patterning alive bacteria or cells using micro-contact printing. Right: Confocal microscope images showing the control on the shape of the printed cells. Each cell has a surface of approximately 900 µm². Images obtained by fluorescence microscopy of cells confined to various shapes (all with areas of 900 µm²). The cells were stimulated with PDGF and stained with phalloidin and 4'-6-Diamidino-2-phenylindole to visualize F-actin (green) and nuclei (blue).

### Organic position sensitive photodetectors

**Funding:** Chinese Scholarship Council Call 2011  
**Duration:** 2012-2016  
**Principal Investigators:** Dr. Juan Cabanillas, Dr. Feng Luo, Dr. Miguel Angel Niño & Dr. Paolo Perna

This research line aims at developing organic photodetectors based on multilayer small molecules which deliver a linear change in photocurrent depending on the position of the impinging light on the pixel. The idea to produce spatial tuning of photocurrent in one single pixel exploits optical interference in multilayer structures as well as antibiotic photocurrent response [1]. We have recently developed devices able to monitor lateral displacements with a spatial sensitivity close to 500 mm [2].

**Figure.** (Left) Optical modelling of the in-depth distribution of light across a multilayer photodetector. (Right) Dependence of photocurrent as a function of position.
Multilevel magnetic recording in bit patterned media for areal densities above 5 Terabit-per-square-inch

Funding: Chinese Scholarship Council Call 2011
Duration: 2012-2016
Principal Investigator: Dr. Feng Luo

The project aims at developing a new magnetic recording media at a proof-of-concept level for ultrahigh density magnetic storage applications, by using low-cost, environmentally friendly processes, and both advanced and new nanotechnologies.[1] It has been shown that 40 nm period island arrays with almost perfect ordering on flat SiO2 substrate surfaces can be achieved and 25 nm period patterns have already been demonstrated. With further reducing the dimension of the interference mask of EUV-IL or optimizing the e-beam lithography parameters, the sub-20 nm period pattern can be achieved. [2-3]

Figures: (Left) Schematic Figure of fabrication of patterned magnetic arrays; (Right) SEM image of 50 nm-period SiOx pillars and magnetic dot arrays
Other research projects currently running at IMDEA Nanociencia Institute are:

**MULTIFUN**

“MultiFunctional Nanotechnology for Selective Detection and Treatment of Cancer”

**Funding:** FP7-NMP-2010-LARGE-4 nº 262943-2  
**Partners:** Consortium of 16 European partners coordinated by ATOS Origin and IMDEA Nanociencia (Scientific coordination)  
**Duration:** 2011-2015  
**Principal Investigators:** Dr. Rodolfo Miranda, Dr. Francisco Terán, Dr. Aitziber López-Cortajarena & Dr. A. Somoza

The aim of the MultiFun consortium is to develop and validate a novel and minimally-invasive nanotechnology system to improve cancer diagnosis and treatment. MultiFun nanotechnology is based on multifunctionalised magnetic nanoparticles (MNP) to selectively target and eliminate breast and pancreatic cancer (stem) cells. The improved magnetic features of the MultiFun MNP will lead to medical applications such as contrast agents and magnetic heating inductors. Moreover, MNP can be functionalised with ligands in order to facilitate tumour diagnosis by MRI. Targeting peptides and antibodies will be employed against cancer (stem) cells leading to early cancer detection, an increase of the effectiveness and reducing side effects. The same MNP will be used simultaneously as functional nanocarriers and heating inductors in order to provide a multimodal therapeutic modality. The synergistic effects of drugs, peptides, small RNAs and heat will be evaluated to determine the effectiveness of different therapeutic combinations.

![Figure 1: schematic representation of the MNP functionalities related to the theragnostic approach.](image-url)
MAMA
“Unlocking research potential for multifunctional advanced materials and nanoscale phenomena”

Funding: FP7-REGPOT-2010-1 n° 264098
Partners: Consortium of 11 European partners coordinated by the CNR-SPIN, Italy
Duration: 2010 - 2014
Principal Investigators: Dr. Rodolfo Miranda & Dr. Paolo Perna
http://mama.spin.cnr.it/

Multifunctional materials are defined as those materials that perform specific functions other than possessing a load bearing capacity. Examples include semiconductors, magnetic materials, piezoelectric and ionic conductors. In this context, transition metal oxides (TMOs) have been attracting an ever-increasing interest, due to the wide variety of physical properties that they exhibit, including unconventional superconductivity, piezo- and ferroelectricity, colossal magneto-resistance, multi-ferroicity and a number of exotic magnetic, charge and orbital orderings. Still, the analysis and modelling of hybrid heterostructures, where layers of functional organic materials represent an ultimate and even more ambitious challenge. Such features are believed to open the route to the fabrication of device prototypes where multiple functionalities of TMOs and functional organic layers are nano-integrated on the same chip. The range of application sectors is correspondingly large, including: information and communications technology, energy generation, storage and transport. Within the project the CNR-SPIN Campania aims at unlocking its research potential to face the scientific challenge behind the complexity of multifunctional advanced materials and nano-scale phenomena. By exploiting the available partnerships expertises and experimental endowment, complemented by the new resources provided within the project, the CNR-SPIN Campania aims at achieving the highest level of competitiveness about issues of i) materials fabrication, by addressing the growth of very high quality samples in the different shapes of epitaxial thin films and single crystals, also integrated together in complex hetero-structures and; ii) advanced material characterizations, both based on matter-light interaction, on scanning probe techniques and on electron-magnetic transport, iii) theoretical modelling and advanced multi-scale computation to analyze and get insight into different physical properties of innovative materials.
ONDA

“Ordered heteroand Nano-structures with Epitaxial Dielectrics for magnetic and electronics Applications”

Funding: FP7-PEOPLE-2009-IRSES nº 247518.
Partners: Consortium of 7 European partners coordinated by the University of Modena and Reggio Emilia (Italy) and IMDEA Nanociencia (Scientific coordination)
Duration: 2010-2014
Principal Investigators: Dr. Rodolfo Miranda & Dr. Julio Camarero

The objective of the project is to strengthen the research cooperation between EU and Russia in the strategic field of ultrathin nano-structured materials for advanced electronic applications through a program of exchange of researchers.

One of the goals of the project is the training of the exchanged researchers into experimental techniques and procedures that are commonly not applied at their parent institutions. For instance, early stage/young researchers, that are undertaking their professional formation, benefit of the exchange opportunity to expand their knowledge and to increase their opportunity of career development.

ONDA scientific activity regards the realization and study of ultrathin layered dielectric materials based on inorganic dielectrics (mainly fluorides on semiconductors), to promote the growth of suitable classes of materials, such as magnetically ordered hetero- and nanostructures or organic thin films for molecular electronics.

The IMDEA team, shares their expertise and skills in surface science and nanomagnetisms. We perform/train quasi-static and dynamic investigations of the magnetization reversal processes in the developed magnetic nanostructures. Both anisotropies and reversal mechanism are identified by using our home-made high resolution variable temperature vectorial magneto optic Kerr effect magnetometry set-up, with time, angular, temperature and vectorial resolution capabilities.

BIONANOTOOLS

“Protein design to generate bio-functional nanostructures”

Funding: FP7-PEOPLE-2009-IRG nº 246688
Duration: 2010-2014
Principal Investigators: Dr. Aitziber López-Cortajarena

The main objective of this is to understand how the structure and function of proteins are defined by their sequence and to apply learned rules to design new protein-based nanotools. In particular, focuses on a type of proteins called tetratricopeptide repeats
(TPR). They present a simple modular structure, where a small structural unit is repeated in tandem. Overall TPR domains are a very robust system to study protein structure, folding, and function, and to use them as building blocks for protein engineering to generate new functional nano-molecules.

We design functional proteins with defined binding-specificities and structural properties. These novel bio-tools will be extremely useful to monitor and investigate biological processes in vivo, as biosensors for diagnosis to detect disease biomarkers, and also as building blocks for applications in biomaterials design.

Fig 1. Bionanotools generation. Protein design for generation of tailored properties and modification of size, stability and function.

MRLSMO
“LSMO based magnetoresistive sensors”

Funding: CNRS Projet de coopération PICS 2012 France / Espagne N° Système: 157683
Duration: 2012-2014
Principal Investigator: Dr. Paolo Perna

The MRLSMO project is a cooperation project financed by the CNRS that focuses on the fabrication and characterization of half metallic perovskitic oxide La0.7Sr0.3MnO3 (LSMO) based magnetoresistive sensors. The project is established between the GREYC (CNRS-UMR 6072) laboratory and the Nanomagnetism’s group at IMDEA Nanociencia Institute. With the aim of optimizing the magnetoresistive performances of the LSMO-based structures, we plan to investigate all the aspects concerning the fabrication of devices, i.e. thin film deposition and photolithography, structural characterization of materials, study of the magnetic properties (magnetic anisotropy), magnetoresistance and noise measurements.

The strength of the project relies on the multidisciplinarity of the partners in electrical engineering for GREYC and in nanomagnetism physics for IMDEA Nanociencia.
The two groups already demonstrated a strong scientific collaboration as demonstrated by several common publications on the investigation of the magnetization reversal processes, on the magnetic anisotropy and on the magnetoresistive response in this system.

3.4.2. National programs

PROBIOMAT
“Tailored protein biomaterials” “Biomateriales a la Carta”

Funding: Spanish Ministry of Science and Innovation (Fundamental Research Programme) BIO. 2012-34835
Duration: 2013-2015
Principal Investigator: Dr. Aitziber López-Cortajarena.

The precise synthesis of materials with tailored properties is a requisite for their use in nanotechnology and medicine. Bottom-up self-assembly that relies on molecular interactions of small defined components, is an attractive approach for biomaterial design and nanostructure templating.

In this project we use self-assembling proteins to generate templates for nanofabrication and biomaterials. We aim to rationally assemble biocompatible functional materials by the combination of simple protein building blocks with specified properties. In order to develop rational approaches for the design of complex nanostructures, we will define sequence-structure-assembly relationships for model designed repeat protein. We will then synthesize new protein molecules with unique assembly properties to generate higher order structures with desired properties and geometries.

This project is based on the deep molecular understanding of the components in order to combine them to generate nanostructures with defined properties.

![Fig 1. Schematic representation of bottom-up approach for engineering novel functional assemblies.](image-url)
EFISOL
“Synthesis and Design of new sensitizers for the preparation of more efficient DSSC”

Funding: Spanish Ministry of Science and Innovation (Fundamental Research Programme)
CTQ2012-30668
Duration: 2013
Principal Investigator: Dr. Juan Luis Delgado

In this project a number of strategies have been proposed for the improvement of all the fragments within the Donor-π-conjugated bridge-Acceptor scheme.

To this end, as first activity, we propose the introduction of light harvesting units, such as oligomers of thiophene or multichromophoric fragments, in order to improve the absorption properties of the donor unit. The second and third activities deal with the structural modification of the acceptor fragment and the bridge, to achieve a better electronic communication between the donor and the acceptor units.

Finally, the last activity describes the utilization of quantum dots as sensitizers to prepare DSSC. Through suitable control of the size we expect to control the absorption properties of the QD, and therefore increase the efficiency of the devices.

As example of applications currently based on this technology, the company G24i started the commercialization of the “Grätzel solar bag”, able to power small electronic devices such as cell phones. It is important to note however that this technology is currently under research in order to improve the stability and price of the final devices. ¹

ColQDMol

“Colloidal Semiconducting Quantum Dot Molecules Studied by Scanning Tunneling Spectroscopy and Tunneling Current-Induced Luminescence”
“Moléculas de puntos cuánticos semiconductores coloidales estudiadas mediante espectroscopia tunel de barrido y luminiscencia inducida por la corriente túnel.”

Funding: Spanish Ministry of Science and Innovation (Fundamental Research Programme) FIS2012-33011
Duration: 2013-2015
Principal Investigator: Dr. Roberto Otero

The aim of this project is to fabricate molecules of colloidal semiconductor quantum dots (QDs) on graphitic surfaces, and the investigation of their electronic and optical properties with a Scanning Tunneling Microscope operated at cryogenic temperatures. Most of the previous studies on QD molecules have been carried out on epitaxially grown nanostructures. For these systems, the control over the possible geometries for the quantum dots is limited and they are very sensitive to atmospheric exposure. Colloidal QDs, on the contrary, are much more stable under ambient conditions, due to the surface passivation provided by the organic ligand shell, and their lateral position on a solid surface can be controlled very precisely by means of STM manipulations. While spectroscopy with the STM should give us information about the change of the electronic levels due to the presence of neighboring QDs, the optical coupling can be studied through the luminescence induced by the tunneling current.

STM image (41 nm x 41 nm, Vt = 3700 mV; It = 10 pA) showing a close-packed array of CdSe QDs on a HOPG surface

FASAMEX

“Friction at the Nanoscale: anisotropy effects and influence of mechanical excitations”

Funding: Spanish Ministry of Science and Innovation (Fundamental Research Programme) MAT2012-38810 & MAT2011-26312
Duration: 2013-2015
Principal Investigator: Dr. Enrico Gnecco.

The main goal of this project was to study anisotropy effects in atomic-scale friction. The investigated surfaces included carbonate minerals, alkali halides, graphene and organic molecules self-assembled on crystal surfaces. An example is given in Fig. 1, where a friction map of CuPc molecules grown on dolomite is shown. Most of the experimental results could be reproduced using the Prandtl-Tomlinson model.
We have also performed nanomanipulation experiments to estimate the shear stress required to detach heteroepitaxially grown nanoislands (Fig. 2) and to relate the trajectories of nanoparticles to the friction force between particles and substrate (Fig. 3). The samples consisted in carbonate minerals and in metal or metalloids deposited on solid lubricants such as MoS2 and graphite.

The influence of mechanical vibrations on friction and the use of anisotropic substrates for nanomanipulation will be systematically explored in the continuation of this bridge project, which retains the same name.

**DNA-COMPASS**

“Super-resolution microscopy of DNA: optimization through correlative microscopy and spectroscopy”

“Microscopia de super-resolución de ADN: optimización a través de microscopia correlativa y espectroscopia”

**Funding:** Spanish Ministry of Science and Innovation (Fundamental Research Programme)  
MAT2012-34487  
**Duration:** 2013-2015  
**Principal Investigator:** Dr. Cristina Flors

This project will use two complementary tools to further develop super-resolution imaging of DNA. First, a novel correlative super-resolution fluorescence/atomic force microscope will be implemented. DNA nanostructures of controllable size and shape labelled with DNA-binding dyes will be used as test samples and imaged using the novel setup. The ability to correlate super-resolution and topography will be crucial to optimize the performance of the dyes, characterize undesired distortions of DNA structure, and identify possible super-resolution imaging artefacts. In addition, since the control of the photophysics of the dye/DNA complexes is crucial to improve the achievable spatial resolution, a combination of
ensemble and single-molecule spectroscopic measurements will be used to study these complexes. This will allow us to understand important processes such as photoblinking. Finally, the improved protocols for super-resolution imaging will be used to study DNA nanostructure in cells.

**DNAdyn**

“Single molecule studies of the mitochondrial DNA replication dynamics”

**Funding:** Spanish Ministry of Science and Innovation (Fundamental Research Programme). BFU2012-31825

**Duration:** 2013-2015

**Principal Investigator:** Dr. Borja Ibarra.

Mitochondria are the energy-producing organelle in animals, and mitochondrial function impacts nearly every aspect of cellular function, being critical for life. A full understanding of the mitochondrial function is in need for an in-depth characterization of the mechanochemical processes that govern the operation of the molecular motors involved in the replication of the mitochondrial DNA. We propose to employ a combined approach of biochemistry, structural biology, and single molecule biophysics involving optical tweezers, to study the dynamical and mechanochemical principles responsible for the activity of the proteins involved in the replication of the human mitochondrial DNA. The long-term objective of our research is the elucidation of the mechanism of DNA replication in animal mitochondria, and its relationship to mitochondrial mutagenesis and human disease.

**SIESPER**

“Towards perpendicular spintronic devices: magnetization reversal processes in out-of-plane exchange biased nanostructures”

**Funding:** Spanish Ministry of Science and Innovation (Fundamental Research Programme). MAT2011-25598.

**Duration:** 2012-2014

**Principal Investigator:** Dr. Alberto Bollero

Advances from Materials Science, Physics and Engineering have led to dramatic improvements in information technology applications (hard disks, magnetic memories, sen-
In particular, an important effort has been done along the last decades by scientific and industrial research groups to increase the magnetic memory storage density through further miniaturization of devices.

SIESPER focuses on the study of the magnetization reversal processes in continuous and nanostructured multilayers prepared by sputtering and by molecular beam epitaxy. This goes through a successful understanding of, among others, the relevance of the preparation conditions (deposition parameters, patterning process...) on the final microstructural and magnetic properties of the nanostructured films together with effects due to the physical reduced sizes of the nanostructures. These aspects are of fundamental importance in the final performance in practical technological applications such as sensors (read heads,).

**Figure.** (a) Unequal closure domains configuration responsible of the phenomenon of exchange-bias observed in a ferromagnetic-ferromagnetic bilayer. (b) AFM (left) and MFM (right) images showing the topography and magnetic domain configuration, respectively, for nanostructures (lines) of the magnetic system shown in (a).

---

**CONMOL**

“Tailor-made Conjugated Molecular Materials via Intra- and Intermolecular Control”

**Funding:** Spanish Ministry of Science and Innovation (Fundamental Research Programme). CTQ2011-27317.

**Duration:** 2012-2014

**Principal Investigators:** Dr. Johannes Gierschner (PI), Dr. Larry Lüer & Dr. Begoña Milián-Medina

The rational design of conjugated organic materials for optoelectronics with defined electronic, optical and photophysical properties in the solid state suffers from the complex interplay of intra- and intermolecular contributions, and from disorder usually found in polymeric samples. CONMOL thus explore structurally and electronically well-defined oligomeric materials forming single
crystals. Experimental photophysical studies, hand-in-hand with advanced structural characterization and quantum-chemical calculations provide an in-depth understanding of solid state exciton signatures and their fate, and how this ultimately controls the emissive and multi-stimuli response in organic materials. This opens the path towards the design of supramolecular assemblies through specific secondary forces for bright emissive, color-tunable organic crystals, showing superior lasing, sensing, or charge transport properties.

**SIMMA**

*Synthesis of Advanced Molecular Machinnery*

**Funding:** Spanish Ministry of Science and Innovation (Fundamental Research Programme). CTQ2011-25714.
**Duration:** 2012-2014
**Principal Investigator:** Dr. Emilio Pérez

We intend to investigate the possibility of synthesizing “molecular swimmers” molecules capable of moving directionally faster than diffusion. To do that, we have designed a series of designs based on the three linked spheres model, extensively investigated from the theoretical point of view. This system can be adapted to synthetically accessible targets based on lasso-type interlocked molecules. A second part of the project is dedicated to the synthesis of molecular machinery based on single wall carbon nanotubes. In particular we plan to synthesize rotaxanes based on SWNTs.

**NanoOligo**

*Modified Oligonucleotides in Nanomedicine: gene detection and gene inhibition by RNA interference*

**Funding:** Spanish Ministry of Science and Innovation (Fundamental Research Programme). SAF2010-15440.
**Duration:** 2011-2013
**Principal Investigator:** Dr. Álvaro Somoza

Oligonucleotides are excellent materials in nanotechnology due to their reduce size (within the nanometer scale) and their assembly capabilities that allow the preparation of very complex structures based on DNA or the assembly of assorted nanostructures. Oligonucleotides have a great potential in nanomedicine as well since they can be employed in the preparation of nanostructures for the detection and/or regulation of genes involved in diseases.

In this project we aim to develop gene sensors and control the gene expression using gold nanoparticles modified with oligonucleotides.
Gold nanoparticles have interesting optical properties due to the surface plasmon resonance. These nanostructures have a reddish color when are well dispersed but it turns bluish when are aggregated. Based on this phenomenon we will prepare sensors for single-point mutations that are associated with cancer.

On the other hand, gold nanoparticles can be used as delivery system, particularly, we will functionalize gold nanoparticles with small interferin RNAs (siRNA) to block the expression of genes involved in cancer. The functionalized nanostructure will be able to reach the cancer cells, cross the cell membrane and release the siRNAs to inhibit the selected oncogenes.

**POLYDYE**

“Conjugated polymer based optical amplifiers for chemical sensing”

**Funding:** Spanish Ministry of Science and Innovation (Fundamental Research Programme), TEC2010-21830-C02-02.  
**Duration:** 2011-2013  
**Principal Investigator:** Dr. Juan Cabanillas

Conjugated polymers have several properties which makes them highly suitable for optical sensing. Examples are high photoluminescence quantum yield in solid state, notable optical gain properties, exciton diffusion lengths exceeding 10 nm and ease of processing into waveguides and laser resonators. Exploiting ASE emission of conjugated polymers in waveguides for sensing has the advantage of increasing the sensitivity to fluorescence quenchers compared to conventional fluorescent sensors since non linear emission is dramatically reduced by their presence at the polymer surface. In this project we develop rib planar waveguides based on polyfluorene with widths comprised between 20 and 200 µm and 800 nm height. Typical analytes targeted are NO2 and amines. Capping of the polymer waveguide with monolayers of photoactive molecules is investigated as a way to fine tune the sensitivity and selectivity of the waveguide sensor.

*Figure (from left to right): Topography image of 100 µm waveguide ribs. ASE emission characteristics as a function of excitation fluence.*
**NANOBIOMAGNET**

“Fundamentals and applications of molecules, magnetic nanoparticles and nanostructures: from spintronics to biomedicine”

**Funding:** Programas de Actividades de I+D entre grupos de investigación de la Comunidad de Madrid. S2009/MAT-1726  
**Duration:** 2010-2013  
**Principal Investigator:** Dr. Rodolfo Miranda  
[www.nanobiomagnet.es](http://www.nanobiomagnet.es)

NANOBIOMAGNET is a research project entitled “Fundamentals and Applications of molecules, magnetic nanoparticles and nanostructures: from spintronics to biomedicine”. The project is framed in the R & D activities program of the Community of Madrid, co-financed by the European Social Fund, whose development takes place between 2010 and 2014.

NANOBIOMAGNET involves eleven research groups from public research institutions and two laboratories of the Laboratory Network of the Community of Madrid (REDLAB) and is coordinated by Professor Rodolfo Miranda. NANOBIOMAGNET comprises various facets of work on nanostructures, molecules and magnetic nanoparticles.

Some of the activities explored in NANOBIOMAGNET are: using ordered sets of magnetic spots as high density information storage media, using magnetic nanoparticles in treatment of tumors by hyperthermia and the formation of ordered structures of nanowires for screening or developing protective coatings against electromagnetic radiation.

**MADRISOLAR2**

“Photo-and Electroactive materials for organic and hybrid solar cells”

**Funding:** Programas de Actividades de I+D entre grupos de investigación de la Comunidad de Madrid. S2009/MAT-1726  
**Duration:** 2010-2013  
**Principal Investigator:** Dr. Nazario Martín

The aim of this Project is focused on the design, development and optimization of new and suitable Materials for light harvesting and their further application in the preparation of photovoltaic devices. This ambitious objective requires a multidisciplinary effort ranging from the chemical synthesis to produce functional materials to the understanding of the physical phenomena responsible for the photovoltaic response of the devices.
Thus, in this context, the main tasks will be the synthesis of new photo- and electroactive compounds with: i) a control on their HOMO-LUMO energy levels, ii) a better absorption in the visible and near infrared, iii) a better charge mobility (electrons and holes), iv) a better control on the morphology at the nanometer scale and, v) possibility of geometrical and electronic design through theoretical calculations. The aforementioned goals should lead to a more competitive photovoltaic technology in our country.

**NOBIMAT-M**

**“New materials and hybrid biofunctional devices in Nanoscience”**

**Funding:** Programas de Actividades de I+D entre grupos de investigación de la Comunidad de Madrid. S2009 / MAT-1507.

**Duration:** 2010-2013

**Principal Investigator:** Dr. J. López Carrascosa

This Program is aimed to study new materials and hybrid bio-functional tools in Nanoscience. It is composed by nine research groups covering molecular and cellular biology, biophysics, chemistry and nanotechnology, from IMDEA Nanoscience, CSIC, Autonomous University and Complutense University of Madrid. The objectives of the program includes the preparation, characterization and engineering of biological functional modules, the manipulation of biological complexes at the single molecule level, the modification of lipid surfaces to integrate biological complexes, the generation of lipo-protein nanoparticles for drug delivery, and the generation of ultra-sensitive tools for detection of biological molecules.

The Program has resulted up to date in 8 PhD theses, and more than 60 publications in JCI Journals.

**NANOMADRID**

**Know Science Today Opens the Future’s Doors**

**Funding:** FECYT

**Duration:** 2012-2013

www.nanomadrid.es

The aim of this project is to promote the transfer of scientific knowledge to the society. Particularly, we aim to engage high school students with science, since we believe that the current students are the future of the Spanish science. We plan to achieve our goals through dynamic workshops at the schools and high schools, where students can have
a direct contact with current science. Our team is composed by several professors and researchers from different institutions around Madrid, which are participating in several events for the promotion of science at schools. We have prepared a website where the people interested can contact us to prepare a specific workshop at their schools.

3.4.3. **Companies**

**Aernnova and Deimos Space (Perigeo Consortium)**

- Graphene pasivation of planetary atmospheric entry shields

**Abengoa Research**

- Conductive Printable Graphene Inks
- 2D-COF Water Desalinization

**HM Hospitals and Roche Pharma**

- Nanoparticles for Glioblastoma Multiforme

**Laboratorios Rubió and Hospital RyC**

- Prove of Concept siRNA Renal Failure Predictor Test
3.5. Fellowship and internships

3.5.1. Fellowship

7FP Marie Curie Action. AMAROUT I
(until 1st March 2013, end of the project)

Incoming Fellowships

Call 2012
Dr. Cristina Flors, Dr. Pawel Nita, Dr. Marta Mroz, Dr. Koen Lauwaet

Call 2011
Dr. Fabián Calleja, Dr. Miguel Angel Niño, Dr. Shinto Varghese

Call 2010
Dr. Enrico Gnecco, Dr. Feng Luo

Call 2009
Dr. Paolo Perna, Dr. Larry Luer

7FP Marie Curie Action. AMAROUT II
(since 1st October 2012, start of the project)

Incoming Fellowships

Call 2013
Daniel Ortega

Call 2012
Ismail Hijazi (until June 2013)

Reintegration Fellowships
Dr. Isabel Rodríguez

Spanish Ministry of Science and Innovation

Ramon y Cajal Programme

Call 2011
Dr. Francisco Terán, Dr. Cristina Flors, Dr. Begoña Sot

Call 2009
Dr. Larry Luer, Dr. Juan Cabanillas

Call 2008
Dr. Emilio Pérez, Dr. Juan Luis Delgado (until December 2013), Dr. Teresa González

Call 2007
Dr. Johannes Giershner (until January 2013), Dr. Ricardo Arias, Dr. Alberto Bollero (until February 2013)

Juan de la Cierva Programme

Call 2011
Dr. Paolo Perna

Technical Support Specialist Programme

Call 2013
Rebeca Amaro

Call 2011
Dr. Santiago Casado

Spanish Ministry of Education

FPU Programme. Predoctoral Grant

Call 2011
Macarena Calero

Chinese Scholarship Council

Call 2012
Junqing Shi. “Supramolecular Nanostructured Multi-Chromophore Materials”. Four years PhD fellowship

Call 2011
Longfei Wu. “Organic position sensitive photodetectors”. Four years PhD fellowship

Hauyu Feng. “Multilevel magnetic recording in bit patterned media for areal densities above 5 Terabit-per-square-inch” Four years PhD fellowship
3.5.2. Internships

4.1. Centre for Nanofabrication [114]
4.2. Nanomedicine Cooperation with HM Hospitals [118]
The Centre of Nanofabrication

The Centre of Nanofabrication is a joint proposal between the IMDEA-Nanoscience and campus of excellence UAM-CSIC to create a facility of excellence for the fabrication of nanostructures and devices based on a wide range of nanosciences such as 2D materials, nano-optics, photonics, nano-magnetism, bio-chemistry, micro-fluidics, nems&mems, or nanostructured organic semiconductors; among others.

The fabrication of such nanostructures and devices is crucial for fundamental research, but also for the development of prospective nanotechnologies with commercial applications. The Centre for Nanofabrication plays a key role for the development of the strategic plan of IMDEA-Nanoscience as well as of the campus of excellence UAM-CSIC. The Centre of Nanofabrication is hosted in a latest generation clean room, with more than 200m² of clean room surface and more than 500m² in total, including the technical gray area. The whole clean room is installed in a continuous solid concrete vibration-isolation floor, and is fully independent of IMDEA-Nanoscience building, since it has it’s own foundations and services (acclimatisation units, electrical power lines, water drains, earthing, gas lines, exhaust lines, etc.). This clean room is equipped with the all the necessary equipment and safety needs required to warranty the safety, quality and purity of its installations, such as evacuation, filtering and recirculation of air as well as temperature and humidity control. Also it is equipped with all the safety equipment for the manipulation and disposal of hazardous liquids and gases to ensure the safety of the users and environment.

The construction of the clean room has been recently completed at the premises of IMDEA-Nanoscience at the end of 2013.

The clean room is divided in two main areas. The smaller section is approximately 60m² and has a certified air quality of ISO-5 (Class-100). The temperature is kept constant...
at 22±0.5°C and the relative air humidity is kept constant at 50±1%. This section is devoted to lithography processes. Is equipped with electron beam Lithography (e-Beam), Focused Ion Beam Lithography (FIB), Gas Assisted Ion/Electron beam lithography (MultiGIS), Mask-less Optical lithography and Nano-Imprint Lithography. This section is also equipped with a small wet chemistry room for all the processes related to nano and micro lithography, such as resist spinning, curing or developing. The largest section of the clean room is about 140m² and has a certified air quality of ISO-6 (Class-1000). In this section the temperature is kept constant at 22±2°C and the relative air humidity is kept constant at 50±5%. This part is dedicated to sample and device fabrication. The clean room is equipped with several metal thin film evaporators, a unique Atomic Layer Deposition (ALD) reactor with 12 precursor lines and 800°C sample chuck, Inductively Coupled Plasma Reactive Ion etching (ICP-RIE) for deep cryo etching of Silicon compounds, Reactive Ion Etching for Metals and Insulators (RIE), Rapid thermal Processor (RTP), Stylus Profilometer (Dektak), Oxygen Plasma, Ozone Cleaner, Optical Microscopy, Wire Bonder, Diamond Scriber, Probe Satiation and Parameter analyser. This section is also equipped with an encapsulation room and a large wet chemistry room for all wet chemistry related processes like wet etching and cleaning, and comprises three laminar flow hoods one for solvents and bases, one for acids and one for HF. They are all fully equipped with drying spinner, ultra-sounds bath, reflow bath, DI water weir, mega-sounds bath, etc.

The Centre has been designed to provide service to all the scientists at IMDEA-Nanoscience as well as other users at the CEI UAM-CSIC and to a limited extent, elsewhere in Madrid and Spain. The latest available state of the art fabrication technologies will be on hand for the fabrication and manipulation of metallic, semiconducting and organic nanostructures and nanoscience-based devices. The centre of nanofabrication will provide the researches and users within the Cantoblanco campus of the UAM and in the framework of the Campus of Excellence project, with an efficient access to the necessary nanofabrication resources to be internationally competitive. Since IMDEA-Nanociencia is an institute created and financed jointly by the regional Government of Madrid and the Government of Spain, the Centre of nanofabrication is intentionally planned to be able to provide under demand services of nanofabrication to researchers of public institutions as well as to private companies.
Layout of the Centre of Nanofabrication clean room at IMDEA-Nanoscience.

ISO-6 Section (Sala 2) of the Clean Room immediately after it was completed.

ISO-5 Section (Sala 5) of the Clean Room immediately after it was completed.

Wet chemistry laboratories at the ISO-6 section (left, Sala 3) and at the ISO-5 section (right, Sala 4).
e-Beam Lithography test structures. Typical linewidth is 80nm for 100nm thick PMMA resist after a metal deposition and lift-off process with 20nm of Cr.

Inauguration “nano-placa” fabricated by direct FIB milling Lithography of 100nm of Au on Si.

Bow-Tie optical nano-antenas fabricated by direct FIB milling lithography of 100nm of Au on Glass.

Array of semiconducting quantum dots fabricated on few layer MoS2 by Gas assisted e-Beam milling Lithography. The top-right inset shows an optical image of the device.

Combined e-Beam and mask-less optical lithography. An array of superconducting dots (top-right inset) with 100nm diameter was fabricated by e-Beam lithography in an area of 100 by 200 um2. A probing electrical bridge was fabricated on top of the dot array by mask-less optical lithography. The overlay accuracy is shown to be better than 200nm (top-left inset).
Nanomedicine cooperation with HM Hospitals

Nanomedicine is the medical application of nanotechnology and related research and covers areas such as nanoparticle drug delivery, nonmagnetic hyperthermia, improved imaging and possible future applications of molecular nanotechnology. It is a multidisciplinary area involving physicians, physicist, chemist, biologists and biomedical engineers working together in the development of better diagnostic and therapeutic tools based on novel nanomaterials, advanced nanoelectronics and nanobiosensors. It also involves understanding and controlling issues related to biocompatibility, toxicity and environmental impact of nanoscale materials.

Many institutions doing scientific research in nanotechnology are somehow involved in the development on biomedical applications but there is still a great divide between research and practical clinical applications and most of the research efforts never end in practical medical improvements. IMDEA Nanoscience is committed to translational research and it is therefore establishing a network of key alliances with medical institutions to include their expertise at the early stages of research to ensure future transfer of the results from the lab to the hospital. One of these institutions is HM Hospitales, a network of private hospitals located in the Madrid Region.

HM Hospitals owns and operates six hospitals and currently employs about 4,000 healthcare professionals. The flagship of this network the Comprehensive Cancer Center Clara Campal (CIOCC) located at HM University Hospital Sanchinarro one of the best Oncology Centers in Europe. CIOCC is a highly Specialized multidisciplinary center with well staff specialized units in the major cancer types. These units, led by senior physicians, carry patients on advance clinical and translational programs integrating new drugs, laboratory models, molecular pathology and imaging; having the unique qualifications needed for providing highly specialized integral care while offering world class treatments and technology.

CIOCC structure responds to a comprehensive analysis of the most effective, efficient and effective models that exist in the world of cancer treatment, which results in a multidisciplinary approach in which patients are treated integrally in a single center without delay by the various specialists involved in their disease and possible complications. This model of providing care to cancer patients has its origins in translational research protocols and it is now applied with great success by HM Hospitals.
IMDEA Nanoscience and HM Hospitals have joined their efforts to implement the first Nano-oncology Research Program in Spain involving nanoscientists and medical doctors and biologists in a common facility focused on implementing translational research projects and nanotechnology based medical applications mainly focused on cancer research. This program is being carried out at IMDEA’s Nanomedicine Lab which is physically located at the IMDEA Nanoscience building and has been equipped with state of the art research instruments to carry out advance nanomedicine projects. The Nano-oncology Program is coordinated with the rest of infrastructures owned and operated by both IMDEA Nanoscience and HM Hospitals and is supervised by Prof. Rodolfo Miranda, Director of IMDEA Nanociencia and Dr. Cristóbal Belda, Director of Neuro Oncology at HM Hospitales. Currently more than 10 scientist and technician work at this lab on this program

**Current Research projects and collaborations in the Joint Program**

- Improved diagnostics and imaging of cerebral cancer through the use of superparamagnetic nanoparticles
- Evaluation of new hyperthermia therapies for the treatment of brain tumors with iron oxide nanoparticles
- Studies for the improvement of internalization of nanoparticles in brain malignant cells derived from surgical samples donated by patients
- Improvement of technics for labeling and follow-up of in vivo cells applied to regenerative medicine using nanotechnology

To implement the glioblastoma project IMDEA’s Nanomedicine Lab runs in vitro and in vivo models including established human brain tumor cell lines (2D models), primary cultures of initiating glioblastoma cells derived from CIOCC – HM Hospitals patients (Malignant Stem Cells - 3D Models), surgically removed samples of tumoral and non tumor brain tissue and several in vivo models of mice cells.
